SECTION 1

INTRODUCTION

The TeleProgrammer Assembly System (TAS) allows programs written in TeleProgrammer Assembly Language (TAL) to be assembled on the 8092B TeleProgrammer. User TAS symbolic programs can be introduced from the CCNTROL DATA® 915 Page Reader or from the Mod 33 or Mod 35 Teletypewriter. The system data flow is illustrated in Figure 1-1.

TAS occupies three files on a magnetic tape. File 1 contains the first pass routines which have the capability of substituting a teletype (TTY) input for the normal 915 Page Reader symbolic input. The second file contains a restart procedure (a means of by-passing the first pass on reassemblies) and the Binary Loader program which is read from punched paper tape at the TTY prior to initiating the second pass. The third file contains the second pass routines.

An assembly is a three-pass process since both a binary output and a listing are produced on the TTY. This requires making separate passes for punching the binary paper tape and for printing the listing. Only one program can be assembled at a time -- no stacking is possible.

TAL includes, in addition to the standard 8092 instruction repertoire, a set of 8092 pseudo-codes, a set of 915 Page Reader function and status codes and a set of 915 Page Reader macro functions. The inclusion of the 915 function and status codes and macros simplifies the coding of programs written to control the 915 Page Reader.

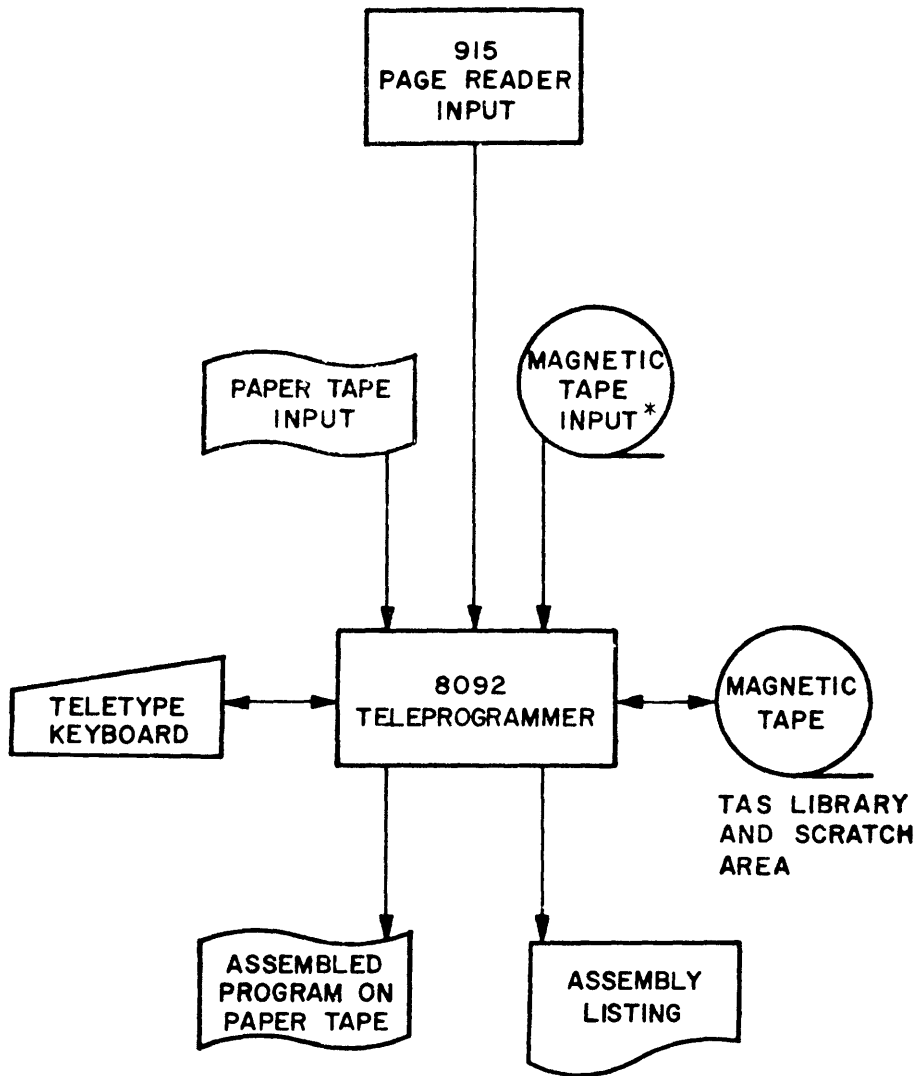

The TAS program operates with the following equipment:

- 915 Page Reader with
- 8022 Page Reader Controller
- 8092 TeleProgrammer
- 8096 or 8196 Input/Output Teletypewriter
- 601 Magnetic Tape Transport with
- 8193 or 8194 Magnetic Tape Controller or
- 608 or 609 Magnetic Tape Transport with
- 8194 Magnetic Tape Controller

The following optional equipment may also be used:

- 8156 Line Printer
- 8291 Paper Tape Punch
- 8299 Paper Tape Reader

When two magnetic tape transports are available, the program can be assembled and loaded faster from magnetic tape input than from 915 Page Reader or TTY input. The 8156 Line Printer, 8291 Paper Tape Punch, and 8299 Paper Tape Reader can be used to increase the speed of input and output operations by using a suitably modified TAS program.

NOTE

* REQUIRES TWO MAGNETIC TAPE TRANSPORTS

Figure 1-1. System Data Flow

SECTION 2

TAS INSTRUCTION REPERTOIRE

8092 TELEPROGRAMMER CODES

For a detailed description of the 8092 instructions refer to the 8092 Teleprogrammer, Programming Reference Manual.

The following symbols describe the operation of instructions:

- t = tag register designation (t = 1, 2, 3 or blank)
- f = function code
- m = 8-bit word execution address (may include address 2 as additive unless n specified)
- n = same as m but second address, no additive allowed.
- y = 8-bit operand (may include address 2 as additive unless z specified)
- z = same as y but second operand, no additive allowed

Load, store, jump, arithmetic logical, input/output, and miscellaneous instructions are defined in Tables 2-1 through 2-7.

TABLE 2-1. LOAD INSTRUCTIONS

Instruction	Function	Octal Code	Number Words	Number of Cycles*
LDN y	Load A, no address	20	2	2
LDM, t m	Load A, memory	21	2	3
LDI, t m	Load A, indirect	22	2	4
LCM, t m	Load A, compl, memory	25	2	3
LCI, t m	Load A, compl, indirect	26	2	4
TTA, t	Tag register to A	03	1	1
CLA	Clear A to zero	03	1	1
BER	Buffer entrance register to A	06	1	1

* Each cycle is 4.33 microseconds.

TABLE 2-2. STORE INSTRUCTIONS

Instruction	Function	Octal Code	Number Words	Number of Cycles*
STM, t m	Store A, memory	41	2	3
STI, t m	Store A, indirect	42	2	4
ATT, t	A to tag register	02	1	1
ABR, t m	A to buffer entrance register	04	2	1 or 2**
ABX, t m	A to buffer exit register	05	2	1 or 2**

TABLE 2-3. JUMP INSTRUCTIONS

Instruction	Function	Octal Code	Number Words	Number of Cycles*
ZJP, t m	Jump if A=0 (positive)	60	2	1 or 2**
NZP, t m	Jump if A≠0	61	2	1 or 2**
PJP, t m	Jump if A positive	62	2	1 or 2**
NJP, t m	Jump if A negative	63	2	1 or 2**
UJP, t m	Unconditional jump	64	2	2

TABLE 2-4. ARITHMETIC INSTRUCTIONS

Instruction	Function	Octal Code	Number Words	Number of Cycles*
ADN y	Add, no address	30	2	2
ADM, t m	Add, memory	31	2	3
ADI, t m	Add, indirect	32	2	4
SBN y	Subtract, no address	34	2	2

* Each cycle is 4.33 microseconds.

** Two cycles are required if a jump is made.

TABLE 2-4. ARITHMETIC INSTRUCTIONS (CONT'D)

Instruction	Function	Octal Code	Number Words	Number of Cycles*
SBM, t m	Subtract, memory	35	2	3
SBI, t m	Subtract, indirect	36	2	4
RAM, t m	Replace add, memory	51	2	4
RAC, t m	Replace add One, memory	55	2	4

TABLE 2-5. LOGICAL INSTRUCTIONS

Instruction	Function	Octal Code	Number Words	Number of Cycles*
LPN y	Logical product, no address	10	2	2
LPM, t m	Logical product, memory	11	2	3
LPI, t m	Logical product, indirect	12	2	4
LSN y	Logical sum, no address	14	2	2
LSM, t m	Logical sum, memory	15	2	3
LSI, t m	Logical sum, indirect	16	2	4

TABLE 2-6. INPUT/OUTPUT INSTRUCTIONS

Instruction	Function	Octal Code	Number Words	Number of Cycles*
INN, t m n	Input, normal channel	72	3	$3+2(n+1)$ †
OUT, t m n	Output, normal channel	73	3	$3+2(n+1)$ †
IBI, t m	Input, buffer channel	70	2	1 or 2**
IBO, t m	Output, buffer channel	71	2	1 or 2**

* Each cycle is 4.33 microseconds.

**Two cycles are required if a jump is made and instruction is not performed.

† Time depends on external equipment transfer rate.

TABLE 2-6. INPUT/OUTPUT INSTRUCTIONS (CONT'D)

Instruction	Function	Octal Code	Number Words	Number of Cycles*
INA	input to A	76	1	2
OTN y	Output, no address	74	2	2
EXF y z	External select	75	3	3

TABLE 2-7. MISCELLANEOUS INSTRUCTIONS

Instruction	Function	Octal Code	Number Words	Number of Cycles*
CIL	Clear interrupt lockout	13	1	1
CIR	Clear interrupt return	113	1	1
CBC	Clear buffer control	07	1	1
ERR	Program halt	00	1	1
HLT	Program halt	77	1	1
DON	Do nothing	02	1	1
SHA	Shift left 1 bit, circular	01	1	1

8092 TELEPROGRAMMER PSEUDO-CODES

The 8092 pseudo-codes are defined in Table 2-8.

TABLE 2-8. 8092 PSEUDO-CODE INSTRUCTIONS

Instruction	Function
SHA y	Generate y shifts (1-7). If the y-field for this instruction is not blank, it will be interpreted and the number of shifts specified, up to 7, will be generated. If interpretation of the y-field results in a value greater than 7, seven shifts will be generated.

* Each cycle is 4.33 microseconds.

TABLE 2-8. 8092 PSEUDO-CODE INSTRUCTIONS (CONT'D)

Instruction	Function
SPL y	Space y lines on listing. The y-field is interpreted and the result specifies the number of lines to be skipped on the listing. If the end of a page is reached, any remaining skips are discarded. In this connection, a y-field value of 60D or more is equivalent to a "skip page" function.
REM	Remarks only follow. A line containing this pseudo-code is printed without modification.
EQU y	Equate tag to tag or tag to constant. The y-term is interpreted and the result equated to the tag found in the location field.
ORG y	Set address counter to y. The y-term is interpreted and the result substituted in the location counter.
BSS y	Increment address counter by y. The y-term is interpreted and the result added to the location counter.
BCD y	Preset storage to following BCD character codes. The y-term is interpreted and the result indicates the number of BCD characters in the comments field. The 6-bit octal equivalents of these characters are generated and stored in consecutive locations. If the y-field value exceeds the comments field (maximum of 39 characters), 39 characters will be interpreted and an error indicated on the listing.
TTY y	Preset storage to following teletype codes. Same function as BCD except 8-bit teletype codes are generated.
(blank) y	One-word constants can be generated by leaving the operation field blank and inserting mnemonics, decimal or octal constants in the address fields. Constants are indicated by a blank operation field code (If the entire line is blank, it will be ignored.) The y-term is interpreted and the result becomes the contents of the current location.

TABLE 2-8. 8092 PSEUDO-CODE INSTRUCTIONS (CONT'D)

Instruction	Function
TAS	Initiate assembly. Location field contains program identification. The first line accepted by the assembler must be a TAS pseudo-code. The first four characters in the location field serve to identify the binary output of the assembly, and these characters may not be blanks.
END	Terminate assembly pass. The last line processed for an assembly must be an END pseudo-operation.

915 PAGE READER FUNCTION AND STATUS CODES

The function codes are used to control 915 Page Reader operations and the status codes enable the 8092 to monitor status conditions within the 915 Page Readers.

The function codes are divided into Class 1, 2, and 3 functions. The Class 1 functions enable the 915 Page Reader to perform the commanded operation only when the 915 Page Reader status is Ready and Not Busy. The Class 2 functions enable the 915 Page Reader to perform the commanded operation when a Ready status exists. The Class 3 status requests and functions are responded to or performed regardless of the 915 Page Reader status.

Class 1 functions are subdivided into Class 1A, 1B, and 1C functions which are described in Table 2-9. Class 1A functions set the parameters of the next operation and cause no status change after the performance of the function. The Class 1B functions initiate mechanical actions which change the 915 Page Reader status to Busy. While Busy status exists, no other Class 1 functions can be performed. The Class 1C functions are program-initiated alarms which cause the 915 Page Reader operation to stop. The status becomes Not Ready and only Class 3 status request functions can be performed until the Not Ready status is cleared.

Class 2 functions cause the three counters on the Operator's panel to be cleared or advanced and enable or clear the SELECT FUNCTION #1, #2, or #3 pushbutton indicators. Class 2 functions are described in Table 2-10.

Class 3 status requests cause the 915 Page Reader to respond with its operational status, and are described in Table 2-11.

Class 3 functions start or stop the 915 Page Reader operation and are described in Table 2-11.

For detailed descriptions of Class 1, 2, and 3 functions, refer to CONTROL DATA® 8022-A/B Page Reader Controller Reference Manual (Pub. No.

TABLE 2-9. CLASS 1 FUNCTION CODES

Instruction	Function	Octal Code	Number Words	Number of Cycles*
<u>CLASS 1A</u>				
SPA	Select page advance	756701	3	3

STP	Stop read and mirror	756747	3	3

915 PAGE READER MACRO INSTRUCTIONS

Macro instructions used to control the 915 Page Reader, the function performed by each instruction, and the machine code generated are listed in Table 2-12.

* Each cycle is 4.33 microseconds.

TABLE 2-12. 915 PAGE READER MACRO INSTRUCTIONS.

Instruction	Function	No. Words	Code Generated
EMV, t	Wait for LMV, RMV or SKL operation to complete. The t must indicate tag register referencing EMV instruction location. EMV is a status loop waiting for a compare status. EMV can be used following LMV, RMV or SKL. A tag register must be designated unless first word lies in bank 0. EMV is not recommended for use because it causes program to wait for a compare operation. The possibility exists that compare will be missed causing a program halt.	8	075 RSI "REQUEST STATUS 1" 067 040 076 INA 010 LPN 20 020 t 60 ZJP,t * -6 "WAIT FOR COMPARE" nnn†
LIN,t y	Input a line to buffer area referenced by tag register t, starting bank address y, and ending address plus one. Right mirror motion must have been initiated. LIN inputs 915 Page Reader characters to buffer area specified by designated tag register, y field (address 1) and additive field (address 2). The y field contains first address and additive field contains number of words to be input.	6	075 LR "REQUEST LINE READ" 067 044 t 72 INN,t "INPUT CHARACTERS" yyy y+z

† nnn refers to the address of the jump generated by the assembler.

TABLE 2-12. 915 PAGE READER MACRO INSTRUCTIONS (CONT'D)

Instruction	Function	No. Words	Code Generated		
LMV y	Start mirror moving left to coordinate y. The y field contains destination coordinate of mirror move.	8	075 067 003 074 yyy 075 067 004	SMR CTN y SCS	"SELECT MIRROR REVERSE" "OUTPUT DESTIN. COORD." "START COORD. SEARCH"
LOC, t	Wait up to 300 milliseconds to find line locator symbol. If found, A REGISTER is positive on exit. The t must indicate tag register referencing the LOC instruction location. LOC searches area of current mirror position for line locator symbol. A status word is then sent to A REGISTER. If line locator symbol is not found, some mechanical motion instruction (e.g., SKP) should be programmed before programming another LOC instruction. Tag register must be designated unless first word of macro instruction lies in bank 0.	11	075 067 007 075 067 040 076 001 t 63 nnn 001	LL RS1 INA SHA NJP,t * -5 SHA	"SEARCH FOR LINE LOC." "REQUEST STATUS 1" "WAIT FOR NOT BUSY"

TABLE 2-12. 915 PAGE READER MACRO INSTRUCTIONS (CONT'D)

Instruction	Function	No. Words	Code Generated
NBY,t y	Test 915 Page Reader status for Not Busy. If Busy status exists, jump to location specified by t and y. If * appears in y field, this indicates wait function.	7	075 RS1 "REQUEST STATUS 1" 067 040 076 INA 001 SHA t 63 NJP,t y "BUSY JUMP" yyy
POS [†] ,t y	Wait until mirror position y is reached. The t must indicate tag register referencing POS instruction location. The y field contains a mirror coordinate. POS waits until mirror reaches this coordinate. POS should be preceded by a move (LMV, RMV, or SKL) instruction. A tag register must be designated unless first word lies in bank 0.	8	075 RMS "REQUEST MIRROR STATUS" 067 041 076 INA 034 SBN y yyy t 61 NZP,t * -6 "WAIT FOR COORD." nnn.
RDY,t y	Test 915 Page Reader status for Ready. If Not Ready status exists, jump to location specified by t and y. If * appears in y field, this indicates wait function.	6	075 RS1 "REQUEST STATUS 1" 067 040 076 INA t 62 PJP,t y "N-READY JUMP" yyy

[†] Occasionally 915 Page Reader skips a coordinate causing NZP instruction to be skipped and leaving program in a loop. After program is assembled, a PJP or NJP instruction, depending on desired mirror direction can be substituted for NZP instruction so that program can leave loop.

TABLE 2-12. 915 PAGE READER MACRO INSTRUCTIONS (CONT'D)

Instruction	Function	No. Words	Code Generated
RJC,t y	Test 915 Page Reader status for Line Reject. If Line Reject status exists (read error), jump to location specified by t and y.	8	075 RS1 "REQUEST STATUS 1" 067 040 076 INA 010 LPN 10 010 t 61 NZP,t y "REJECT JUMP" yyy

			074 yyy	OTN y "OUTPUT DESTIN. COORD."
			075 067 001	SPA "SELECT PAGE ADVANCE"
			074 yyy	CTN "OUTPUT NUMBER LINES"
			075 067 004	SCS "START COORD. SEARCH"
SKP y	Start paper skipping y lines. The y field contains number of lines to be skipped.	8	075 067 001	SPA "SELECT PAGE ADVANCE"
			074 yyy	CTN y "OUTPUT NUMBER LINES"
			075 067 004	SCS "START COORD. SEARCH"

SECTION 3

SYMBOLIC INPUTS AND CODING FORMATS

TAS allows symbolic inputs from the 915 Page Reader or teletype. Preliminary coding for any input medium can be done on a OSAS/OSAS-A TAS 915 Coding Form (Pub. No. AA2212). Data from this form can then be typed and read on the 915 Page Reader for preparation of punched paper tape object program, or input directly from the TTY.

The programmer normally uses either the coding form shown in Figure 3-1 or 3-5 for his handwritten coding. His program is then typed on the TAS 915 Coding Form shown in Figure 3-2 for 915 Page Reader input, punched on paper tape as shown in Figure 3-3 to be input later on the TTY Paper Tape Reader, or typed into the TTY as shown in Figure 3-4. Character and symbol codes for the 915 Page Reader and the Mod 33 and Mod 35 TTY are listed in Table 3-2.

PROGRAM LISTING

A TAS listing produced on the TTY is shown in Figure 3-5. Although 12-bit octal values are represented as storage contents, only the lower 8-bits are punched on the binary paper tape (i.e., 1064 = 064 on tape). Note that after 60 lines are printed, six lines are skipped on the continuous TTY form.

Error lines are indented by four character spaces and contain an error message code character as shown in 1 through 5 of Figure 3-5. Error characters are stored in the character position related to the error field (i.e., location field errors are in the first character position, address 2 errors in the fourth character position). The error message code characters are defined in Table 4-1.

The sample program shown in Figure 3-4 and the sample listing shown in Figure 3-5 contain five programming errors. These errors are defined on the sample listing as follows:

1. The L in the first character position indicates an illegal symbolic tag in the location field. In this case, an alpha "0" was typed in BE01 instead of a zero.
2. The U in the third character position indicates that the address 1 tag was undefined. In this case, BE02 should have a zero rather than an alpha "0".
3. The U in the third character position indicates that the address 1 tag was undefined. In this case, the program was unable to locate BE01 because of error 1.

4. The A in the third character position indicates an illegal format in the address 1 field which in this case is the BEG+3 instruction.
5. The T in the second character position indicates an illegal tag register designator in the operation field. In this case, +4 is an illegal instruction.

BINARY PAPER TAPE

The binary paper tape produced by TAS contains parity bits and checksums for ensuring data validity. Data words are broken into two 4-bit frames. An odd parity bit is included as a five-level punch with the second frame of the data word. Checksums follow all special functions (TAS, ORG/BSS, END) or every ten data words, whichever occurs first. Checksums are the arithmetic sums of the previous checksum and any intervening data words. The following five-place codes identify the special functions punched on a TAS binary tape:

TAS	30 = 11000
ORG/BSS	22 = 10010
END	24 = 10100
CHECKSUM	21 = 10001

CODING FIELDS

LOCATION FIELD

The location field may be blank or may contain a symbolic tag consisting of one to four characters, the first of which must be non-numeric. If a four character tag is used, the last two characters must be numeric. Illegally formatted tags will be flagged as errors on the listing. A symbol which appears in this field more than once in a program will be flagged as an error. Any reference made to such a duplicate or illegal tag will be treated as undefined. The maximum number of tags for a program is 382.

OPERATION FIELD

If the operation field is blank, the address fields will be interpreted as a one word constant. If non-blank, the first three characters of the operation field must be an 8092 instruction or pseudo-operation, a 915 function or status code or a 915 macro instruction. Otherwise, the field will be flagged as an error on the listing. Numeric operation-codes may not be used.

The fourth character of the operation field must be a blank or a comma. If the fourth character is blank, no other character may be put in this field. If the fourth character is a comma, the fifth character of the field (tag register designation) must be a 1, 2, or 3. For 8092 instructions which may reference a tag register, a comma followed by a blank is flagged as an error.

ADDRESS 1 FIELD

The address 1 field may be blank or may contain a signed or unsigned tag or numeric. A single asterisk (*) as the left-most character of the field will be assigned the value of the address of the instruction. A tag in this field which does not appear in a location field somewhere in the program will be flagged on the listing as undefined.

Decimal or octal numerics may be used. Decimal numbers must be terminated with a "D". Octal numbers are terminated by a blank. The largest number allowed is 7777 (octal) or 4095 (decimal).

A sign followed by a blank will be flagged as an error. If the field is found to be in error, zero will be substituted for the field value.

ADDRESS 2 FIELD

Address 1 field rules also apply to address 2 fields. For one-word 8092 instructions and for 915 function and status operations, both address fields are ignored. For two-word 8092 instructions and for the 8092 pseudo-operations (excepting TAS, REM, END), address 2 field is treated as an additive to address 1 field. For three-word 8092 instructions, address 2 field contains the second address.

COMMENTS FIELD

Except for BCD and TTY pseudo-operations, the comments field is ignored and will appear on the listing as it appears on the input document, except that for 915 Page Reader input, leading blanks will be suppressed. Comment field characters may extend through the sequence field.

SEQUENCE FIELD

If the sequence field is non-blank, it will occupy the last six characters on the listing. Any characters from the comment field which occupy these positions will be overlaid by the contents of the sequence field.

915 PAGE READER INPUT FORMAT

Fields on the TAS 915 coding form as shown in Figure 3-2 for the 915 Page Reader are to be filled in with characters typed in ANSI (American National Standards Institute) font. Data lines are to be doubled-spaced. Fields are separated by vertical black lines (field separators). Blanks following these field separators are suppressed so that relative position within a field is unimportant.

If the first four fields of the form are blank, the line will be ignored. If the character "D" (delete) is typed to the left of the first field separator (as shown

in Figure 3-2), the line will be ignored. Lines on which read errors occur are marked and processed as read.

To terminate reading of a page, the symbol "E" (end) is typed to the left of the first field separator after the last line of instructions on each TAS 915 Coding Form, as shown in Figure 3-2. When the 915 Page Reader reads the E symbol, reading on that coding form is terminated and the next coding form is advanced to the read station.

MAGNETIC TAPE INPUT FORMAT

Information is input to the 8092 from a source magnetic tape which was generated using the 8092 Source on Tape (SOT) program. The fields on the source magnetic tape are in punched card image format (80 characters to a record). The contents of each field on this punched card image are similar to the TAS coding form format shown in Figure 3-1. The contents of each field or character position are listed in Table 3-1.

TABLE 3-1. PUNCHED CARD IMAGE FORMAT

Character Position	Content
1	Blank
2 to 5	Location field
6	Blank
7 to 9	Operation field
10	Comma, if required
11	Tag, if required
12	Blank
13 to 17	Address 1 field
18	Blank
19 to 23	Address 2 (additive) field
24	Blank
25 to 74	Comments field
75 to 80	Sequence field

TELETYPEWRITER INPUT FORMAT

Information is input to the 8092 from the TTY by typing in the information at the keyboard or by reading a punched paper tape. Keyboard input is sufficient for relatively short program (100 instructions or less). A drawback is that if errors occur in the assembled program, the entire corrected program must be retyped. Since errors frequently occur in transcribing from the coding sheet, this input method would be inefficient for a large program.

A symbolic punched paper tape can be prepared and edited off line. This tape can then be input from the teletype paper reader. Errors found in the program can then be edited off line and a new paper tape prepared.

DIRECT KEYBOARD INPUT

The following procedure should be followed to input a program into the 8092. The TTY prints a "greater than" symbol when it is ready to accept an input line. The operator then types a line of the program separating each field with a "slash" symbol and terminates the line by pressing "return" key. A "less than" symbol is printed to indicate that the line has been accepted, the carriage returns and the line advances in preparation for the next input. If an error is detected while typing a line, the "rub out" key should be depressed. The line will be ignored and a new input line requested.

PREPARING OFF LINE PAPER TAPE

To prepare an off line symbolic punched paper tape, follow the procedures listed in the Direct Keyboard Input paragraph with the following modifications:

- a. No control characters except "carriage return", "line feed", or "rub out" should be punched. "Line feed" characters and blank frames are ignored if typed.
- b. At least five "fill" characters should be punched after each line to allow time for processing the line and writing a tape record. The "here is" key will produce sufficient blank frames for this purpose unless a message has been wired to this key. If the "here is" key cannot be used, the "line feed" key may be depressed five times as a substitute.

TELETYPEWRITER ERROR MESSAGES

If an input error is indicated, then an illegal input character has been found. Input errors include control characters except "carriage return", "line feed", or "rub out". The line is ignored and a new input requested. If a field error is indicated, then too many characters are in the current field. The line is ignored and a new input requested by using a "greater than" symbol.

SECTION 4

TAS ERROR MESSAGES

Error message codes are written at the beginning of a line on a program listing. The line is then indented four positions to the right. Unique error positions for each of the four fields (i.e., location tag, operation code, address 1, address 2) are present on the listing. Position 1 corresponds to location tag errors; position 2 corresponds to operation code errors; and positions 3 and 4 correspond to address 1 and address 2 errors, respectively. Definitions of error symbols are listed in Table 4-1.

TABLE 4-1. ERROR SYMBOLS

Symbol	Error Field	Pass	Description of the Error
E	1,2,3,4	1	Read error, symbolic input
S	1	1	Symbol Table Full (tag not stored)
L	1	1	Illegal Symbolic Tag
D	1	1	Duplicate Tag
T	2	1	Illegal Tag Register designator (not 1-3)
O	2	1	Illegal Operation Code*
W	3&4	1	Address Field(s) undefined for Pass 1**
A	3	2	Address 1 illegal format
B	4	2	Address 2 illegal format
U	3	2	Address 1 Tag Undefined
V	4	2	Address 2 Tag Undefined
P	3&4	2	Magnetic tape parity error on read
C	3	2	Address 1 and Address 2 too large BCD, TTY value larger than 39 (maximum value), substitute 39. SHA - value larger than 7, substitute 7

* If an operation field code is in error, a three-word instruction is assumed and the address is incremented by this amount.

** Generated when the address field of a BCD, TTY or BSS pseudo code can not be evaluated correctly for Pass 1.

SECTION 5

OPERATING PROCEDURES

Procedures for operating TAS are described in Tables 5-1 through 5-4. Each table contains three columns. Numbers in the Step column indicate operating sequence. The Equipment column indicates the equipment at which each step is performed. The Procedure column describes actions to be performed and the results of these actions.

Table 5-1, Loading and Assembling the Program, contains procedures for normal assembly of a program from typewritten TAS 915 coding forms. During normal assembly, all data input from coding forms is written on the TAS library tape. If the TAS library tape containing this data is saved, the program can be reassembled without rereading the typed input data as defined in Table 5-3.

Table 5-2, Loading and Assembling the Program With Magnetic Tape Input, contains procedures for normal assembly of a program from source magnetic tape using two Magnetic Tape Transports. The source magnetic tape is generated using the 8092 Source on Tape (SOT) program.

Procedures for reassembly without repeating Pass are contained in Table 5-3, Loading and Restart Assembly. These procedures can be used when the TAS library tape containing the input data and symbol Table is saved. If the Binary Loader paper tape is damaged or a new listing is desired, the loading and restart assembly procedures are used.

Table 5-4, Using the Binary Loader, contains procedures used for the input of binary paper tape produced by TAS. The Binary Loader must be read into a memory bank not used by the assembled program to be loaded. The Binary Loader checks the validity of the binary data being loaded and halts if an error is detected. The A and Z REGISTER displays will indicate either successful loading or an error code.

Table 5-5, contains descriptions of abnormal program halts. The numbers in the Step column are for reference purposes only and do not indicate the sequence in which the halts occur. The Register Display column is divided into P, A, and Z REGISTER display columns. The contents of each register are listed for each abnormal program halt. The Procedure column defines the cause of the abnormal program halt and lists the procedures required to eliminate the problem and continue operation.

CAUTION

When setting spring loaded switches, ensure that switch does not spring back into opposite position. Damage to program could result.

TABLE 5-1. LOADING AND ASSEMBLING THE PROGRAM

Step	Equipment	Procedure
1	915/8092 System	Ensure that system is energized.
2	Magnetic Tape Transport	Mount TAS library tape with write ring. Set to Unit 3. Press LOAD and READY pushbutton indicators.
3	8092	Set MASTER CLEAR LOAD switch to MASTER CLEAR. NOTE If 8092 does not have autoloading capacity, perform procedure from step 24.
4	8092	Set LOAD. Set RUN STEP switch to RUN. TAS library tape bootstrap program is read into memory locations 000 through 222. Program halts, P REGISTER displays 223. Set RUN STEP switch to center position.
5	8092	Set MASTER CLEAR. Set RUN. File 1 of TAS is read into memory and TAS library tape rewinds to end of bootstrap program. Program halts, P REGISTER displays 6324, and Z REGISTER displays 77. Set RUN STEP switch to center position. NOTE If abnormal program halt occurs, refer to Table 5-5.
6	Magnetic Tape Transport	Set to Unit 0.
7	8092	Press CLEAR T and TAG REGISTER SELECT 1 pushbuttons simultaneously. Press TAG REGISTER SELECT 1 pushbutton and simultaneously set 17 into TAG REGISTER.

TABLE 5-4. USING THE BINARY LOADER (CONT'D)

Step	Equipment	Procedure						
		<table border="1"> <thead> <tr> <th data-bbox="621 415 889 476"><u>Storage Location</u> (P REGISTER)</th> <th data-bbox="889 415 1170 476"><u>Content</u> (A REGISTER)</th> <th data-bbox="1170 415 1409 476"><u>Interpretation</u></th> </tr> </thead> <tbody> <tr> <td data-bbox="621 537 764 569">014</td> <td data-bbox="889 537 1065 569">000</td> <td data-bbox="1170 476 1409 537">binary object program.</td> </tr> </tbody> </table>	<u>Storage Location</u> (P REGISTER)	<u>Content</u> (A REGISTER)	<u>Interpretation</u>	014	000	binary object program.
<u>Storage Location</u> (P REGISTER)	<u>Content</u> (A REGISTER)	<u>Interpretation</u>						
014	000	binary object program.						
3	8092	<p style="text-align: center;">CAUTION</p> <p>Obtain bank number to be used for Binary Loader program from programmer. Binary Loader program must be read into a memory bank not used by assembled program to be loaded.</p>						
4	TTY	<p>Press TAG REGISTER SELECT 1 pushbutton. Set bank number which will store binary loader program into TAG REGISTER.</p>						
5	8092	<p>Mount Binary Loader and Object Program paper tape generated in steps 16 and 18 of Table 5-1.</p>						
6	8092	<p>Set MASTER CLEAR and set RUN.</p>						
7	TTY or 8299 Paper Tape Reader	<p>Set START STOP FREE switch to START or press READER POWER pushbutton indicator. Binary Loader and Object Program reads in.</p>						
8	TTY	<p>Program halts, Z REGISTER displays 077.</p>						
9	8092	<p style="text-align: center;">NOTE</p> <p>If abnormal program halt occurs, refer to Table 5-5.</p>						
10	TTY	<p>Prints TAS IDENT.</p>						
11	TTY or 8299 Paper Tape Reader	<p>Set STOP or press READER POWER pushbutton indicator.</p>						
12	915/8092 System	<p>To load additional object programs, repeat procedure from step 4, using appropriate paper tape.</p>						

Since the basic TAS assembler uses the end of the magnetic system tape for intermediate storage, the system tape must be used without file protection. For this reason and because it may be desired to save system tape for restart assemblies, a means of copying the system files to a new magnetic tape is required. (See Table 5-4A.)

Each system file contains a routine for loading that file into TeleProgrammer memory and for writing memory contents onto magnetic tape. Thus, by mounting and dismounting tapes the system files may be copied from one tape to another.

TABLE 5-4A. COPYING A MAGNETIC SYSTEM TAPE

Step	Equipment	Procedure
1	8092	<p>Remove file protect ring from system tape to be copied. Select tape unit 3.</p> <p>Load first file.</p> <p>Mount system tape. Load Bootstrap record (see Table 5-1). Master Clear, Run. The first file will be read in, tape rewound and the bootstrap record read. Normal halt, Z - 077. Dismount tape.</p>
2	8092	<p>Write first file.</p> <p>Mount scratch tape. Master Clear, Run. The Bootstrap record will be written followed by memory contents and a file mark. Normal halt, Z = 077. Dismount tape.</p>
3	8092	<p>Load second file.</p> <p>Mount system tape. Load Bootstrap record (see Table 5-1). Master Clear. A = 001. Run. The first file will be skipped. The second file will be read in, tape rewound and the bootstrap record read. Normal halt, Z = 077. Dismount tape.</p>

TABLE 5-4A. COPYING A MAGNETIC SYSTEM TAPE (CONT'D)

Step	Equipment	Procedure
4	8092	<p>Write second file.</p> <p>Mount scratch tape. Master Clear. A = 001. Run. The first file will be skipped. The contents of memory will be written followed by a file mark. Normal halt, Z = 077. Dismount tape.</p>
5	8092	<p>Load third file.</p> <p>Follow the same process as for loading the second file (Step 3) except set A = 002 (skip 2 files).</p>
6	8092	<p>Write third file.</p> <p>Follow the same process as for writing the second file (Step 4) except set A = 002 (skip 2 files).</p>
7	8092	<p>Error Halts, Z = 000.</p> <p>Error Halts indicate a parity error either reading or writing. If put back in run from the halt location, an attempt will be made to reread or rewrite the bad record. No other recovery is possible.</p>

TABLE 5-5. ABNORMAL PROGRAM HALTS

Step	Register Display			Procedure
	P	A	Z	
1	0045		000	Tape error occurred after Pass 1 as bootstrap program loaded first records. Repeat procedure from step 3 of Table 5-1 or step 4 of Table 5-2.
2	6225		000	Tape error occurred after Pass 1 as remainder of file is read into memory. Repeat procedure from step 3 of Table 5-1 or step 4 of Table 5-2.
3	6321		000	Tape error occurred after Pass 1 as bootstrap program is reread. Ignore error unless copying TAS library tape. To ignore error: At 8092 set RUN. Follow procedures from step at which program halt occurred. If copying TAS library tape, repeat procedure from step 3 of Table 5-1 or step 4 of Table 5-2.
4		000	000	Tape error in reading intermediate pass or optional routine. TAS library tape malfunction. Replace TAS library tape and repeat procedure from step 2 of Table 5-1.
		000	000	TAS ident not found after Pass 2. Examine punched paper tape for damage and replace if required. Check alignment of paper tape in Paper Tape Reader. At 8092, set beginning address of Binary Loader into P REGISTER. Set RUN. Follow procedure from step 6 of Table 5-4. If malfunction recurs, prepare a new Binary Object paper tape by performing procedures in Table 5-3.

TABLE 5-5. ABNORMAL PROGRAM HALTS (CONT'D)

Step	Register Display			Procedure
	P	A	Z	
5		001	000	<p>915 is not ready for operation after intermediate pass. Ready 915 by performing procedure from step 8 of Table 5-1.</p>
		TTY prints READY READER		
6		001	000	<p>Parity error occurs after Pass 2. Examine punched paper tape for damage and replace if required. Check alignment of paper tape in Paper Tape Reader. At 8092, set beginning address of Binary Loader into P REGISTER. Set RUN. Follow procedure from step 6 of Table 5-4. If malfunction recurs, prepare a new Binary Object paper tape by performing procedures in Table 5-3.</p>
		002	000	
		TTY prints TAS CARD NOT FOUND		
		002	000	<p>Checksum error occurs after Pass 2. Examine punched paper tape for damage and replace if required. Check alignment of paper tape in Paper Tape Reader. At 8092, set beginning address of Binary Loader into P REGISTER. Set RUN. Follow procedure from step 6 of Table 5-4. If malfunction recurs, prepare a new Binary Object paper tape by performing procedures in Table 5-3.</p>

TABLE 5-5. ABNORMAL PROGRAM HALTS (CONT'D)

Step	Register Display			Procedure
	P	A	Z	
7		003	000	<p>Checksum missing. Malfunction occurs after Pass 2.</p> <p>Illegal special code occurs after Pass 2. Examine punched paper tape for damage and replace if required. Check alignment of paper tape in Paper Tape Reader.</p> <p>At 8092, set beginning address of Binary Loader into P REGISTER.</p> <p>Set RUN.</p> <p>Follow procedure from step 6 of Table 5-4. If malfunction recurs, prepare a new Binary Object paper tape by performing procedures in Table 5-3.</p>
		004	000	
8	TTY prints FAILED TO LINE LOCATE	200	000	<p>Check coding form for line locate bar and correct if necessary.</p> <p>Malfunction occurs after intermediate pass.</p> <p>At 915, load corrected coding form.</p> <p>At 8092, set RUN STEP switch to center position.</p> <p>Set RUN.</p> <p>Follow procedures from step at which program halt occurred.</p>

SECTION 6

ABRIDGED OPERATING PROCEDURES

Abridged operating procedures for TAS are listed in Tables 6-1 through 6-4. The tables contain two columns. Numbers in the Step column indicate operating sequence. These numbers are identical to the step number listed in the corresponding table in Section 5 to enable quick reference to the detailed procedure. The Procedure column contains abridged actions to be performed and the results of these actions. Placard nomenclature is used when referring to the equipment controls and indicators. Equipment at which actions are performed are not listed unless the omission could cause confusion.

The Abnormal Program Halts table was not abridged and therefore possible abnormal program halts are referenced to Table 5-5.

TABLE 6-1. LOADING AND ASSEMBLING THE PROGRAM

Step	Procedure	Step	Procedure
1	Energize system.	8	Load TAS coding forms into 915. Press START. Go to step 12.
2	Mount TAS tape with write ring. Set to Unit 3.	9	Set TTY MODE switch to TTR.
3	Set MASTER CLEAR.	10	Key-in following patch:
	NOTE		<u>Storage</u> <u>Content</u>
	If 8092 does not have autoloading, step 24.		531 132
4	Set LOAD, RUN. Halt, P=223. Set RUN to neutral.		534 135
5	Set MASTER CLEAR. Set RUN. Halt, P=6324, Z=077. Set RUN to neutral.		541 164
	NOTE		Set P=467.
	If abnormal halt, Table 5-5.	11	Set A=002.
6	Tape Transport to Unit 0.	12	Set RUN.
7	Clear TAG REGISTER 1. Set TAG REGISTER 1=17. Set MASTER CLEAR.	13	TAS tape to file 2.
	NOTE	14	Prints TAS PASS 1 and 915 READER INPUT or TYPEWRITER INPUT. If TTY input, type in program. Press ON (TTY Paper Tape Punch) or PUNCH POWER (8291 Paper Tape Punch).
	If 915 input, step 8. If Mod 33 TTY input, step 11. If Mod 35 TTY input, step 9.	15	Input written in scratch area. End of PASS 1, symbol table written on TAS tape.

TABLE 6-1. LOADING AND ASSEMBLING THE PROGRAM (CONT'D)

Step	Procedure	Step	Procedure																
16	Binary Loader paper tape punched.	25	Set MASTER CLEAR. Set P=300. Set RUN. Halt, P=306, A=223, Z=000.																
17	Data records from TAS tape read into memory.	26	Set RUN to neutral. Go to step 5.																
18	Binary (object) program punched. Press CFF or PUNCH POWER.
