CONTENTS

INDEX PERFORMANCE SPECIFICATION

INTRODUCTION

The function of the AUTOMATIC LOAD and DUMP (ALD) is to load 8092B core from magnetic tape or dump 8092B core to a magnetic tape.

When programs or files are being transferred from magnetic tape and 8092B core, the transferring of the words is done by banks and will always start with the word zero of bank zero. The banks will be in consecutive order until either the end of file mark is detected from the magnetic tape, or the last bank (which was indicated for the dumping of the 8092B core) has been reached. The transfer shall not exceed 14 banks of core.

ALD will have the following capabilities:

1. Set up a library of programs or files on the magnetic tapes. Up to 15 files (17 octal) may be recorded on one magnetic tape.
2. Update specific programs or files on the magnetic tape.
3. Add new programs or files to the magnetic tape.
4. Call specific programs or files to be loaded into 8092B core from the magnetic tape.
5. Verify the accuracy of transfers between the magnetic tape and 8092B core.

1. Boot Strap

The first file on tape is the boot strap, which has three records.

A. Record one, BOOTAH and BOOTA

B. Record two, BOOTBH and BOOTB

C. Record three, BOOTCH and BOOTC

1.0 BOOT STRAP

A. BOOTAH, BOOTA

The first 45 frames of this record are 6 bit words making up program BOOTAH. The remaining frames of this record are 4-bit words. When loaded into core this record has the following capability:

The first 45 locations become a program of 6-bit instructions which when executed, assembles an 8-bit program called BOOTA. BOOTA is then executed and assembles the balance of the record, (which are programs COPY and CALL) and stores them in bank 13 starting with word zero.

B. BOOTBH, BOOTB

The first 45 frames of this record are 6-bit words making up program BOOTBH. The remaining frames of this record are 4-bit words. When loaded into core this record has the following capability:

The first 45 locations become a program of 6-bit instructions which when executed, assembles an 8-bit program called BOOTB. BOOTB is then executed and assembles the balance of the record, (which are programs SET and MTLD) and stores them in bank 14 starting with word zero.

C. BOOTCH, BOOTC

The first 45 frames of this record are 6-bit words making up program BOOTCH. The remaining frames of this record are 4-bit words. When loaded into core this record has the following capability:

The first 45 locations become a program of 6-bit instructions which when executed, assembles an 8-bit program called BOOTC. BOOTC is then executed and assembles the balance of the record, (which are programs LPFT and DPTT) and stores them in bank 15 starting with word zero.

2. Program

The following descriptions are for the programs which run in the 8090, or the 160A computer:

A. PACK

This program will generate the boot strap for the Automatic Load and Dump Tape for the 8092 Computer.

Its function is to write three magnetic tape records, end of file mark and code mark (octal 77) in binary and low density. It checks for errors after each record.

The records in this file are:

Record 1 = BOOTAH and BOOTA
Record 2 = BOOTBH and BOOTB
Record 3 = BOOTCH and BOOTC

B. NEW

Its function is to add a <u>new</u> file onto the "Magnetic Automatic Load and Dump Tape".

When programs for the 8092B Teleprogrammer have been assembled by OSAS-A, the binary paper tape output may be loaded into the 8090 or the 160A computer, transferred to the "Magnetic Automatic Load and Dump Tape". The routine will assign a file number to show the file location on the "Magnetic Automatic Load and Dump Tape".

Continuation

These are the programs which run in the 8092B Teleprogrammer

C. COPY

This program copies the first file from AUTOMATIC LOAD and DUMP TAPE. This file is the BOOT STRAP. (The BOOT STRAP is not considered as a file number on this tape.) There are three records to this file.

Record 1 is known as BOOTAH and BOOTA
Record 2 is known as BOOTBH and BOOTB
Record 3 is known as BOOTCH and BOOTC

COPY can output records 1, 2, and 3 on the new tape, write end of file mark, and code mark (an octal 77) which identifies the last file on the AUTOMATIC LOAD and DUMP TAPE.

D. CALL

This program loads the 8092B core starting with word zero of bank zero with the remaining two records of the BOOT STRAP file.

Record one of this file is loaded by the Teleprogrammers load and run switches. When record one is assembled program CALL is stored into bank 13.

CALL will then load 8092B core with record two of the file. Record two is then assembled and stores its programs in bank 14. Record three of the file is then loaded, assembled, and stores its programs in bank 15. CALL then comes to a halt.

Programs are now loaded in their proper banks and ready to perform any job assignment such as:

Dumping 8092B core to the Automatic Load and Dump Tape.
Loading 8092B core from Automatic Load and Dump Tape.
Copying the Boot Strap from the Automatic Load and Dump Tape on a <u>new</u> Automatic Load and Dump Tape.

E. SET

This program checks for the job assignment. If the job assignment is dumping SET will: a) determine if file to be dumped updates an existing

file and set up the number of the file to be updated b) determine if the file to be dumped is a new file to be added to the tape.

If the job assignment is loading, SET will determine the number of the file on magnetic tape to be loaded. SET will initialize all control words, fix program MTLD to either read or write, and exit to programs LPFT or DPTT depending on the job assignment.

F. MTLD

This program will read or write in binary and low density variable length records up to 102 characters over the normal channel. The characters are read into or written from a common input/output area. It checks for parity errors after each record transfer, if an error exists, it will try five times for that record. If the error persists MTLD will come to a halt to indicate the error. When dumping 8092B core on the Automatic Load and Dump Tape the file number will be displayed after completion of the dump in the A register.

When loading a file from the Automatic Load and Dump Tape into the 8092B core, MTLD will compare check sums for the verification of the loading. When complete file is loaded MTLD will come to a halt. The contents of the A register will display the following:

Zero in the A register, the file was loaded correctly
Non Zero in the A register, the file was loaded incorrectly.

G. DPTT

This program prepares the 8092B core for output to the Automatic Load and Dump Tape starting with word zero of bank zero.

Each word to be outputted is added to a check sum counter and then processed as follows:

The word is divided into two 4-bit words with the high order 4-bits being identified. The two 4-bit words are then stored into the input/output area. When the input/output area has reached 102 words, DPTT releases control to MTLD.

After processing the last word, the check sum is processed in the same manner. The check sum then becomes the last two words of this record, which will be less than 102 words.

H. LPFT

This program assembles the words in the input/output area which were inputted by the Program MTLD from the Automatic Load and Dump Tape.

The input/output area is filled with 4-bit words.

Two 4-bit words are combined to one eight bit word, checksummed, then stored in 8092B core starting with word zero of bank zero, the store address is then incremented by one. When the storing is completed, LPFT releases control to MTLD. This process will continue until MTLD detects an end of file mark on the Automatic Load and Dump Tape.

OPERATIONAL SPECIFICATION

MAGNETIC "AUTOMATIC LOAD AND DUMP TAPE"

FOR THE

8090 OR THE 160-A COMPUTER

INDEX

I. HARDWARE REQUIRED

A. The 8090 computer with a 603 Tape Drive using the 8071 synchronizer, or the 160A computer with a 603 Tape Drive using the 162 synchronizer.

2. RESTRICTIONS

A. When a new file is to be added to the magnetic "Automatic Load and Dump Tape", the starting point for the output will always be memory location zero, and will be by multiples of 400 memory locations.

B. The dumping of the new file should not exceed memory location (7000).

3. GENERATE A MAGNETIC "AUTOMATIC LOAD AND DUMP TAPE"

a. Mount the magnetic tape that is to be an "Automatic Load and Dump Tape" on tape drive 3. Set tape drive 3 to LOW DENSITY and in a ready state with the magnetic tape at LOAD point.

b. MASTER CLEAR computer, and ZERO out memory locations.

c. Turn the paper tape reader on, set to read in 7 level paper tape. Put the paper tape that is marked "PACK" into the paper tape reader. Enter manually "~~7300~~ 7270" in the P-REGISTER. Put the LOAD switch into the up position, then the RUN switch into the up position. The computer will come to a halt with the following information in the REGISTERS:

P = 7715, A = 0000, Z = 0000

Return the RUN and LOAD switches to the normal (center) position.

d. MASTER CLEAR computer

Enter, manually "~~7300~~ 7270" in the P-REGISTER. Put the RUN switch into the up position. The computer will come to a halt with the following information in the REGISTERS:

P = 7543, A = 0060, Z = 7700

Return the RUN switch to the normal (center) position.

e. MASTER CLEAR computer

Enter, manually "~~7300~~ 7270" in the P-REGISTER. Put the RUN switch into the up position. The computer will come to a halt with the following information in the REGISTERS:

P = 7543, A = 0000, Z = 7700

Return the RUN switch to the normal (center) position.

f. MASTER CLEAR computer.

Entry, manually "7000" in the P-REGISTER. Put the RUN switch into the up position. The computer will come to a halt with the following information in the REGISTERS:

P = 7244, A = _____, Z = 7700

Return the RUN switch to the normal (center) position.

g. The magnetic tape on tape 3 is now a magnetic "Automatic Load and Dump Tape". The only file on the tape is the BOOT-STRAP, which is a self storing program.

h. ERROR STOPS

Return the RUN switch to the normal (center) position.

1. P = 7116, A = 0002, Z = 7700

REASON: Tape Drive 3 is not ready.

RECOVERY: Correct the condition of tape drive 3. Put the RUN switch into the up position.

2. P = 7160, A = 7777, Z = 7700

REASON: Parity error detected on five successive attempts to write.

RECOVERY: Restart with step 3a (above), and use a different magnetic tape in step 3a.

I. If the computer stops and none of the error stops described above appear, restart beginning at step 3a (above).

4. ADD A FILE TO THE MAGNETIC "AUTOMATIC LOAD AND DUMP TAPE".

a. Mount the magnetic "Automatic Load and Dump Tape" on tape drive 3. Set tape drive 3 to LOW DENSITY and in a ready state with the magnetic tape at LOAD point.

b. MASTER CLEAR computer, and ZERO out memory locations.

c. Turn the paper tape reader on, set to read in 7 level paper tape. Put the paper tape that is marked NEW into the paper tape reader. Enter, manually "~~7300~~ 7270" in the P-REGISTER. Put the LOAD switch into the up position, then the RUN switch into the up position. The computer will come to a halt with the following information in the REGISTERS:

P = 7715, A = 0000, Z = 0000

Return the LOAD and RUN switches to the normal (center) position.

d. MASTER CLEAR computer

Enter, manually "~~7300~~ 7270" in the P-REGISTER. Put the RUN switch into the up position. The computer will come to a halt with the following information in the REGISTERS:

P = 7543, A = 0000, Z = 77000

Return the RUN switch to the normal (center) position.

e. Remove the paper tape (NEW) from the paper tape reader. Insert the binary paper tape which was created by the OSAS-A assembly in the paper tape reader. Enter, manually "~~7300~~ 7270" in the P-REGISTER. Put the RUN switch into the up position. The computer will come to a halt with the following information in the REGISTERS:

P = 7543, A = 0000, Z = 7700

Return the RUN switch to the normal (center) position.

f. Enter, manually "7000" in the P-REGISTER. Enter manually the last address to be dumped on the magnetic tape into the A-REGISTER.

NOTE: The first word to be dumped is memory location zero. Put the RUN switch into the up position. The computer will come to a halt with the following information in the REGISTER:

P = 7266, A = FILE-NUMBER, Z = [illegible]

Return the RUN switch to the normal (center) position.

The A-REGISTER will then contain the file number for the file just dumped on the "Automatic Load and Dump Tape".

G. ERROR STOPS

Return the RUN switch to the normal (center) position.

1. P = 7014, A = 0077 ~ 0000, Z = 7700

   REASON: If the A-REGISTER equals "0077", the program to be added is too large (exceeds 7000) for dumping. If the A-REGISTER equals "0000", the last memory address location for dumping was not entered.

   RECOVERY: A-REGISTER equals (0077). NONE
   A-REGISTER equals (0000). Enter, manually the last memory address location for dumping. Put the RUN switch into the up position.

2. P = 7055, A = 0002, Z = 7700
   P = 7203, A = 0002, Z = 7700
   P = 7226, A = 0002, Z = 7700

   REASON: Tape unit 3 is not ready.

   RECOVERY: Correct the conditions of tape unit 3, put the RUN switch into the up position.

3. P = 7102, A = 0020, Z = 7700

   REASON: The "Automatic Load and Dump Tape" already has 17 octal files recorded.

   RECOVERY: Restart with step 4a (above) and use a different Automatic Load and Dump Tape in step 4a (above).

4. P = 7237, A = 0006, Z = 7700

   REASON: Parity error detected on five successive attempts to write.

   RECOVERY: Restart with step 4a (above) and use a different "Automatic Load and Dump Tape" in step 4a (above).

H. If the computer stops and none of the error stops described above appear, restart beginning at step 4a (above).

OPERATIONAL SPECIFICATION

MAGNETIC AUTOMATIC LOAD AND DUMP TAPE

FOR THE

8092B TELEPROGRAMMER

INDEX

1. Hardware Required

   a. One 8092B Teleprogrammer

   b. 601 Magnetic Tape Drive with a 8193 synchronizer or,
      603 Magnetic Tape Drive with a 8093B synchronizer

2. Restrictions

   a. When a program or file is to be transferred from the Magnetic Automatic Load and Dump Tape, and 8092B core, the following will always be true:

      1. They start with word zero of bank zero
      2. The transferring is done by banks
      3. The banks are in consecutive order
      4. The maximum bank is bank 14

   b. The Magnetic Automatic Load and Dump Tape shall not exceed 15 (17 octal) files

   c. When a specific program or file is to be updated, the file size must not be altered

3. Generating a new "Magnetic Automatic Load and Dump Tape" (BOOTSTRAP ONLY).

a. Mount the "Magnetic Automatic Load and Dump Tape" on tape drive 3. Set tape drive 3 to a ready state with the magnetic tape at load point.

b. Master Clear 8092B computer

Put the LOAD switch into the up position, then the RUN switch into the up position. One record will be read from the magnetic tape on tape drive 3. The computer will come to a halt with the following information in the registers

P = 1401 OR 1403, A = 377, Z = 0.

Return the LOAD and RUN switches to the normal (center) position.

c. MASTER CLEAR 8092B Computer

Put the RUN switch into the up position. Computer will come to a halt with the following information in the registers.

P = 6716, A = 0, Z = 077.

Return the RUN switch to the normal (center) position.

d. Enter, manually "360" in the A-REGISTER.

Put the RUN switch into the up position. Computer will come to a halt with the following information in the registers

P = 6561, A = 377, Z = 077

Return the RUN switch to the normal (center) position.

e. Mount the magnetic tape that is to be the new "Magnetic Automatic Load and Dump Tape" on tape drive 3.

Put the RUN switch into the up position. Computer will come to a halt with the following information in the registers.

P = 6605, A = 0, Z = 077

Return the RUN switch to the normal (center) position.

f. The magnetic tape on tape drive 3 is now a "Magnetic Automatic Load and Dump Tape". The only file on the tape is the BOOT STRAP, which is a self storing program.

g. ERROR STOPS

Return the RUN switch to normal (center) position.

1. P = 6421, A = 002, Z = 077
   Tape drive 3 is not in ready state. Correct the condition and put the RUN switch into the up position.

2. P = 6510, A = 000, Z = 077
   Parity error detected on five successive attempts to read or write

   a. If error occurs on read, the automatic load and dump tape may be bad. In this case a different load and dump tape must be used in setp 3a (above).

   b. If error occurs on write, restart from Step 3a, and use a different tape in Steps 3c (above).

h. If the computer stops and none of the error stops described above appear, restart beginning at step 3a, above.

4. LOADING A PROGRAM OR FILE FROM THE "MAGNETIC AUTOMATIC LOAD AND DUMP TAPE" INTO THE 8092B CORE.

a. Mount the "Magnetic Automatic Loand and Dump Tape" on tape drive 3. Set tape drive 3 to a ready state with the magnetic tape at load point.
Master Clear 8092B computer
Put the LOAD switch into the up position, then the RUN switch into the up position. One record will be read from the nagnetic tape on tape drive 3. The computer will come to a halt with the following information in the registers

P = 1401 OR 1403, A = 3577, Z = 000.

Return both the LOAD and RUN switches to the normal (center) position.

b. MASTER CLEAR 8092B COMPUTER
Put the RUN switch into the up position. The computer will come to a halt with the following information in the registers.

P = 6716, A = 0, Z = 077

Return the RUN switch to the normal (center) position.

c. Enter into the "A-REGISTER" the file number that is to be loaded in the lower 4-bits of the A-REGISTER.

NOTE:

A-REGISTER

Bits	3	2	1	0
	F	I	L	E

not used for loading a file — File Number

If files 1 to 7 are to be called, enter the A-REGISTER with that specific file number. If files 8 to 15 are to be called, enter the A-REGISTER with that specific file number in OCTAL.

Put the RUN switch into the up position. When the computer halts, the file which was specific is now stored into the 8092B core. The registers are as follows:

P = 7361, A = ZERO / NON-ZERO, Z = 077.

If the A-REGISTER is other than zero, the file specified was not loaded correctly. Restart with step 4a.

If the A-REGISTER equal to zero, the file specified was loaded correctly.

d. ERROR STOPS

Return the RUN switch to the normal (center) position.

1. P = 7003, A = 000, Z = 077.

REASON: No assignment job was specified.

RECOVERY: Enter the job assignment into the A-REGISTER.
Put the RUN switch into the up position.

2. P = 7102, A = 002, Z = 077.

REASON: Tape drive unit 3 was not ready.

RECOVERY: Correct the condition of the tape drive
Put the RUN switch into the up position.

3. P = 7203, A = 000, Z = 077

REASON: File requested from the (ALD) does not exist.

RECOVERY: None

4. P = 7275, A = 022, Z = 077

REASON: Parity error detected on five successive attempts to read or write

RECOVERY: None. Restart from step 4a (above) and use a different (ALD) tape

5. P = 7372, A = 377, Z = 077

REASON: The program or file which was to be dumped on the ALD tape exceeds bank 14.

RECOVERY: None (program is too large for dumping)

6. P = 7656, A = 000, Z = 077

REASON: File requested from the ALD does not exist

RECOVERY: None

If the computer stops and none of the error stops described above appear, restart beginning at step 4a (above).

5. DUMPING A PROGRAM OR FILE FROM THE NAGNETIC AUTOMATIC LOAD AND DUMP TAPE (ALD)

a. The routines that execute the 8092B core dump are stored in banks 14 and 15 (octal 16 and 17). If a program is to be dumped after execution, it cannot use banks 14 or 15 since to do so, would destroy the dump routine.

b. When a specific file on the ALD is to be altered and the revised file does not alter the previous file size it may return to the ALD under the same file number. If the revision does alter the previous file size, it must be dumped as a new file on the ALD.

INSTRUCTIONS FOR DUMPING TO THE ALD

c. Mount the ALD tape (on which the file is to be recorded) on tape drive 3. Set the tape drive to a ready state with the ALD at load point.

MASTER CLEAR THE 8092B Computer

SET TAG2 to bank 14 (16 octal)
SET TAG3 to bank 15 (17 octal)
SET THE P-REGISTER TO 7001.

d. Enter in the A-REGISTER the total number of banks to be dumped. If the dump is to be an updating of the ALD as the same file, then enter the file number also in the A-REGISTER. If the file is to be added to the ALD leave the A-REGISTER file indicator bits blank.

A-REGISTER

Bit Positions 7 6 5 4 3 2 1 0 of the A-REGISTER
Bit Positions 3 2 1 0 3 2 1 0 of the indicators.
B A N K F I L E

Bank Indicator	File Indicator

Put the RUN switch into the up position. The computer will come to a halt

with the following information in the registers.

P = 7352, A = FILE NUMBER, Z = 77.

Return the RUN switch to the normal (center) position.

e. The A-REGISTER will then contain the file number (for the file just dumped) on the ALD.

f. ERROR STOPS

Return the RUN switch to the normal (center) position.

1. P = 7003, A = 0, Z = 77

   REASON: No assignment job was specified

   RECOVERY: Enter the job assignment into the A-REGISTER.
   Put the RUN switch into the up position

2. P = 7102, A = 2, Z = 77

   REASON: Tape drive unit 3 was not ready

   RECOVERY: Correct the condition of the tape drive.
   Put the RUN switch into the up position.

3. P = 7203, A = 0, Z = 77

   REASON: File requested from the ALD does not exist

   RECOVERY: None

4. P = 7275, A = 22, Z = 77

   REASON: Parity error detected on five successive attempts to read or write

   RECOVERY: None. Restart from step 5c above and use a differet ALD tape

5. P = 7372, A = 377, Z = 77

   REASON: The program or file which was to be dumped on the ALD tape exceeds bank 14.

   RECOVERY: None. (Program is too large for dumping.)

6. P = 7656, A = 0, Z = 77

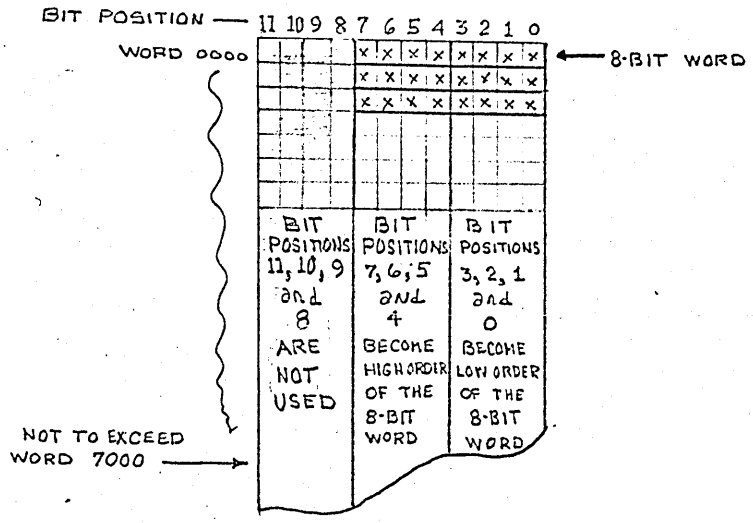
   REASON: File requested from the ALD does not exist

   RECOVERY: None

g. If the computer stops and none of the error stops described above appear, restart beginning at step 5c, above.

PROGRAM NEW
FORMAT

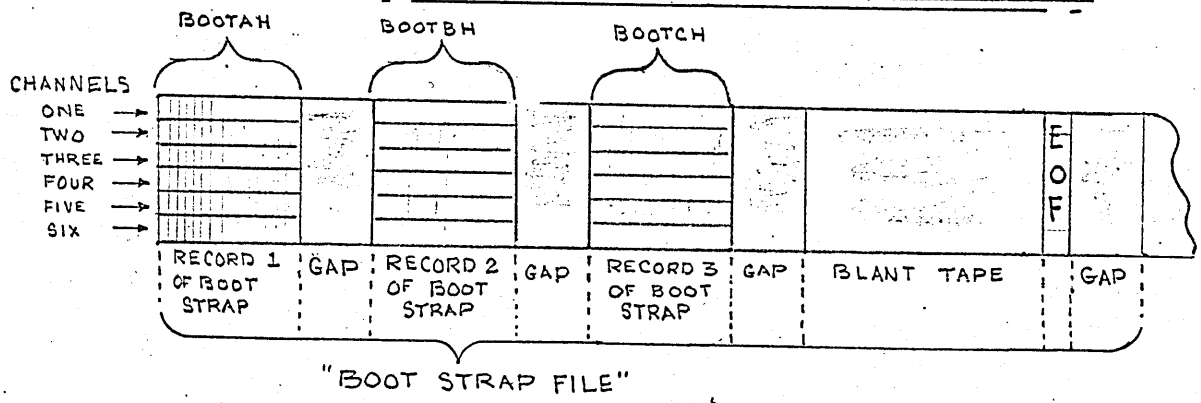
8090 OR 160A COMPUTER
MEMORY



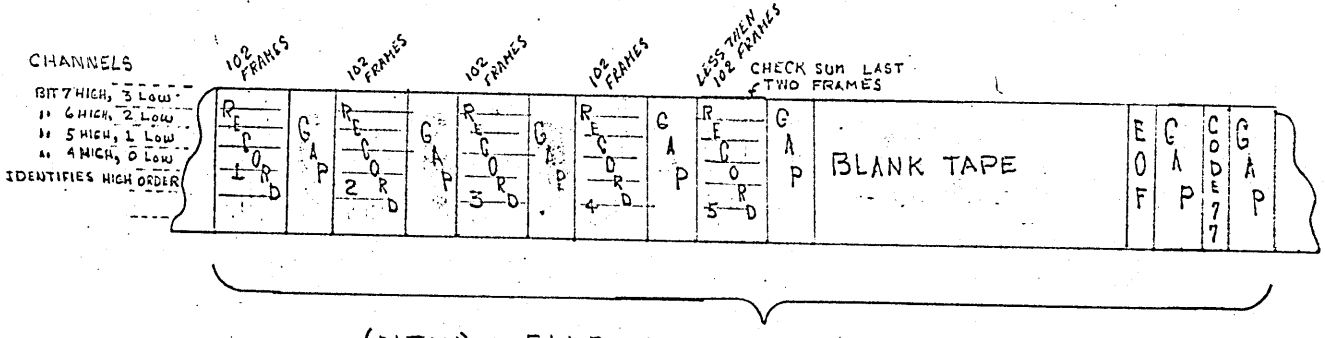
IT TAKES THE 8-BIT WORD DIVIDES THEM INTO TWO 4-BIT WORDS, THE HIGH ORDER BEING SHIFTED TO BITS 3, 2, 1 AND 0, BIT 4 IS ADDED TO IDENTIFIE HIGH ORDER BITS OF THE 8-BIT WORD.

THEY ARE OUTPUTED AS A NEW FILE ON THE MAGNETIC "AUTOMATIC LOAD AND DUMP TAPE" AS 102 FRAMES PER RECORD. THE LAST RECORD OF THE FILE, IS LESS THEN 102 FRAMES. THE LAST TWO FRAMES CARRY THE CHECKSUM OF THE 8-BIT WORDS IN THAT RECORD.

MAGNETIC "AUTOMATIC LOAD and DUMP TAPE."



"BOOT STRAP FILE"



(NEW) → FILE ADDED TO MAGNETIC TAPE

N Nicholas

NEW

I. Function

A. General

Program NEW is executed by the 8090 or the 160A Computer. After a program is assembled by OSAS-A for usage with the 8092B computer (Teleprogrammer). It maybe added onto the magnetic "Automatic Load and Dump Tape" and recorded as a specific file for further use with the 8092B Computer.

B. Detail

The binary output paper tape from the OSAS-A assembly of a program, can be loaded with the binary loader into the 8090 or the 160A computer. Program NEW will take each output word and save the lower 8-bits of that word, it will checksum that word and divide it into two 4-bit words. Each 4-bit word is placed in the low order of the output word. NEW identifies the high order 4-bits of the 8-bit word by adding bit position four. It searches the magnetic "Automatic Load and Dump Tape" for the last file, and it then will output the 4-bit words onto the magnetic "Automatic Load and Dump Tape" in record lengths of 102 characters. The last record to be in this file will carry the checksum of the 8-bit words in the last two frames. It will display a number in the A-REGISTER indicating the location of file on the magnetic "Automatic Load and Dump Tape".

II. CONTROL WORDS

NEWA	The last word address of the 8-bit words to be outputted.
NEWB	Checksum of each 8-bit word before storing for output.
NEWC	Programs file number on the (ALD) that was just outputted.
NEWD	Storage of the 8-bit word while being processed.
NEWG	Switch test to indicate the last record for the file being outputted.
NEWH	Last word address of the record for writing on magnetic tape.
NEWF	The start address for the 102 characters to be outputted.

III. ENTRY POINT

NEW

IV. EXIT

NONE

PROGRAM NAME
NEW

OUTPUTS NEW FILE ON (ALD) FROM 8090 OR 160A COMPUTER TO A 603 TAPE DRIVE.

PROGRAMS CONROL WORDS

- NEWA — LAST WORD ADDRESS FOR DUMPING
- NEWB — CHECKSUM OF EACH 8-BIT WORD BEFORE STORING
- NEWC — PROGRAMS FILE NUMBER ON THE (ALD) TAPE
- NEWD — PROCESSING OF THE 8-BIT WORD.
- NEWG — SWITCH FOR LAST RECORD TO BE DUMPED
- NEWH — LAST WORD ADDRESS FOR THE SIZE OF THE RECORD
- NEWF — OUTPUT AREA 102 CHARACTER.

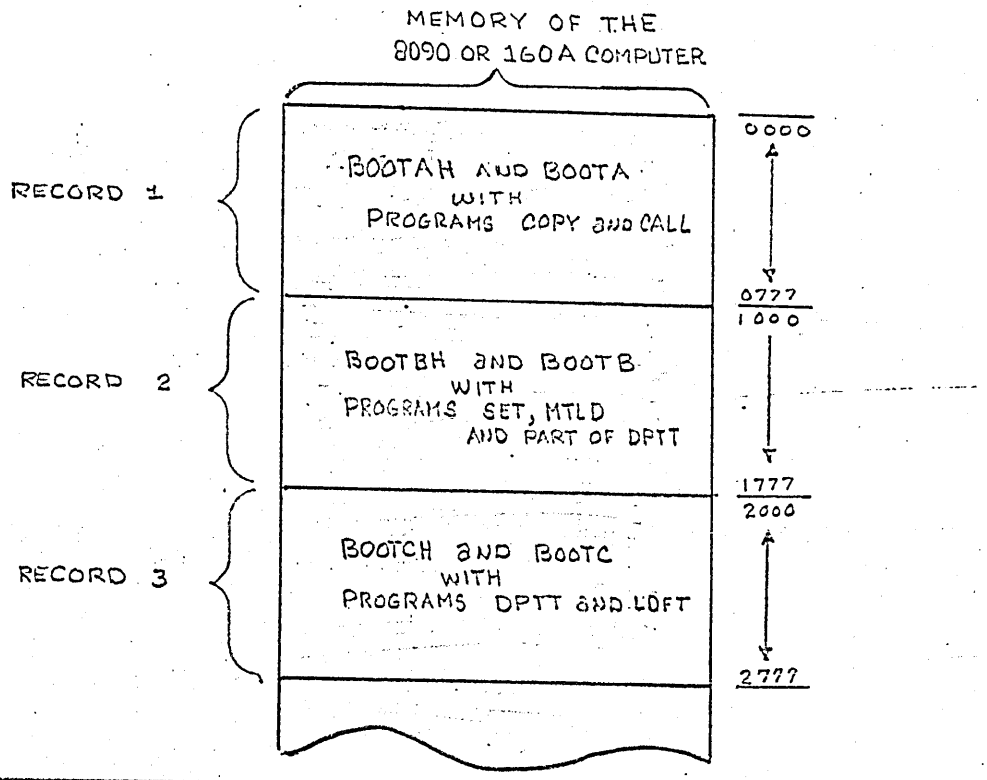
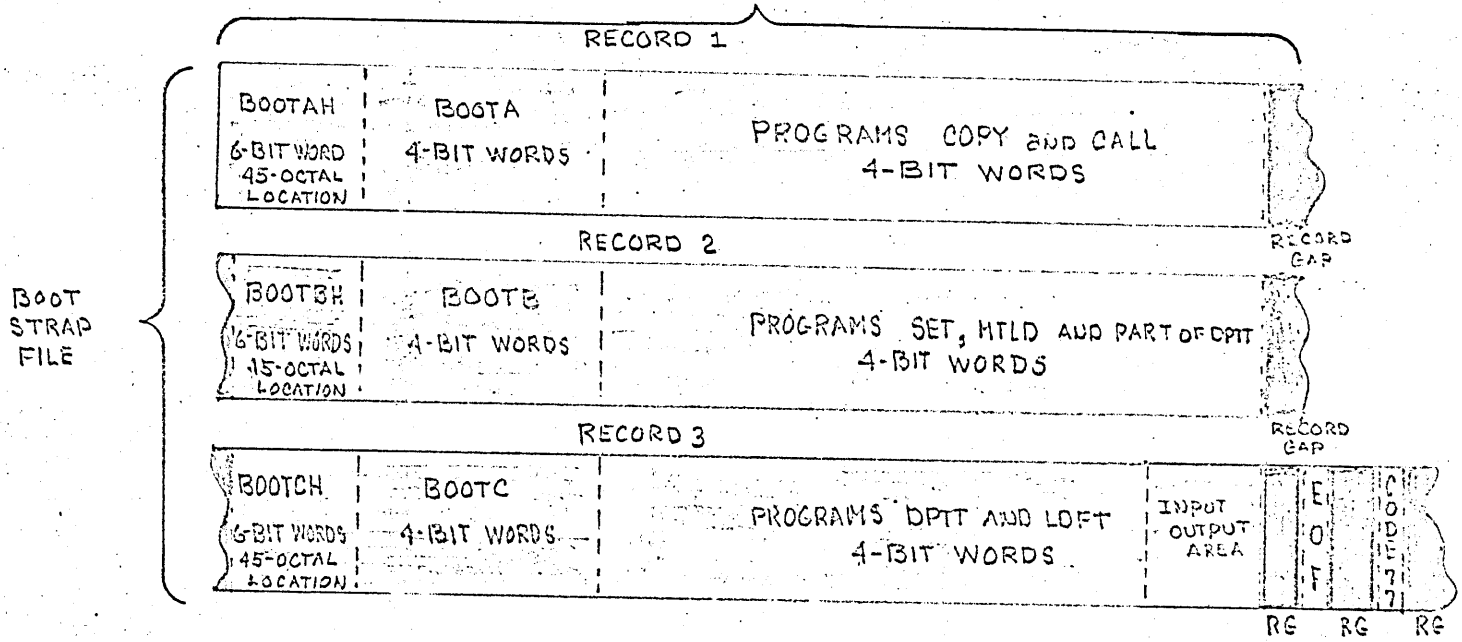
PROGRAM PACK FORMAT



RECORDS OF THE OUTPUT STORED ON MAGNETIC TAPE.



IT TAKES THE MEMORY LOCATIONS FROM 0000 TO 2777 OF THE 8090 OR 160A COMPUTER and OUTPUTS THEM TO THE MAGNETIC TAPE. STARTS WITH RECORD 1, THEN RECORD 2 AND 3 FOLLOWS.

N Nicholas

PACK

I. Function

A. General

This program is for the 8090 or 160A Computer and will generate the BOOT STRAP on the Automatic Load and Dump Tape which can be used by the 8092B Computer.

B. Detail

The binary output paper tape from the OSAS-A assembly for the BOOT STRAP is loaded with a binary loader into the 8090 or 160A core starting at word zero.

Records of the BOOT STRAP take the following Core locations. Record one, is in 0000 to 0777, record two is in 1000 to 1777 and record three is in 2000 to 2777. The first 45 octal locations of the records use only the low 6-bits of the 12-bit word, and are stored into an output area. The remaining locations use the lower 8-bits of the 12-bit word, and are divided into two 4-bit words with the high order of the 8-bit word being identified, then are stored into an output area.

Record one is processed in this manner first, then is outputted to the magnetic tape in the binary and low density mode, record two and three follow. The end of file mark is then outputted and followed with a code mark. (Octal 77). The magnetic tape is now an Automatic Load and Dump Tape for the 8092B Computer.

II. Control Words

PACKA	Starting address of the record being dumped.
PACKB	Last word address, for the 6-bit words first, then the 4-bit words.
PACKC	Starting address of the output area.
PACKD	Temporary storage for the 12-bit words.
PACKE	Counter for the output of the three records.

III. Entry Points

None

IV. Exits

None

PROGRAM NAME
PACK

OUTPUTS BOOT, TO MAGNETIC TAPE
FROM 8090 TO A 603

PROGRAM CONTROL WORDS

PACKA	START ADDRESS OF PROGRAM BEING DUMPED
PACKB	STOP ADDRESS 1ST 6BITS THE 4BIT FREWORD
PACKC	START ADDRESS OF OUTPUT AREA
PACKD	TEMPORARY STORING OF CHARACTER
PACKE	COUNTER FOR 3 RECORDS FOR OUTPUT.

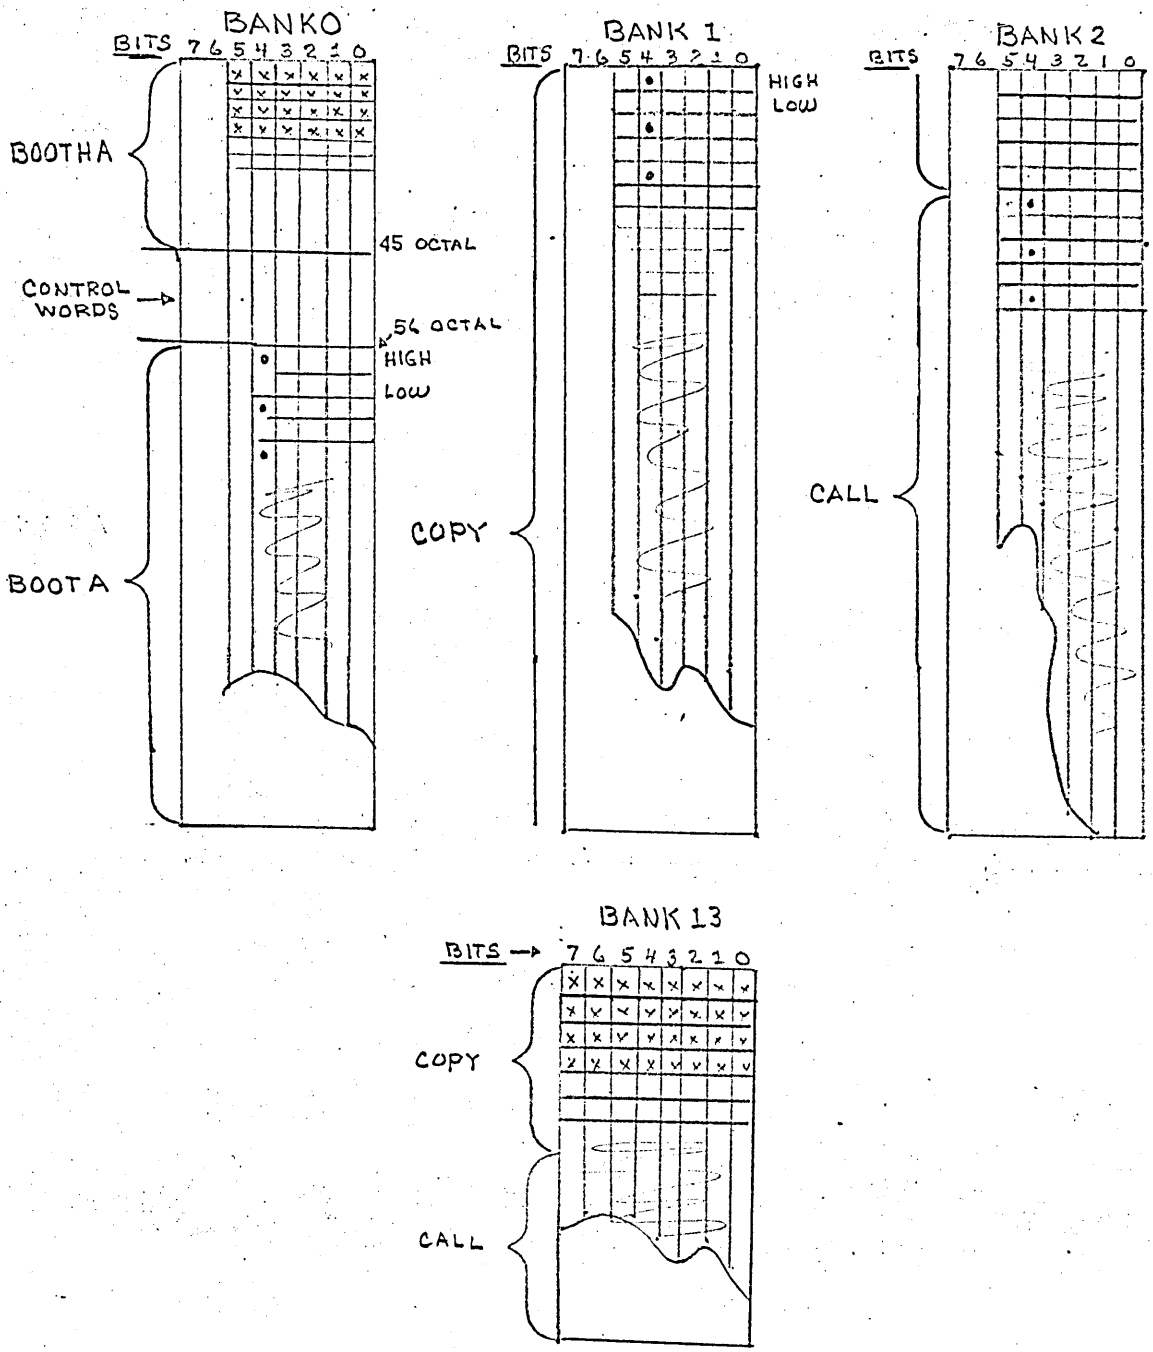
BOOTHA and BOOTA FORMAT



BOOTHA : BANK-0, THE FIRST 45 OCTAL LOCATION ARE 6-BIT WORDS. BANK-0 FROM 56 (OCTAL) TO 376 (OCTAL) OF BANK 2, . THEY ARE 4-BIT WORDS WITH THE HIGH ORDER FOR AN 8-BIT WORD BEING IDENTIFIED BY BIT POSITION 4.

BANK 13 COPY AND CALL

AFTER, THE 4-BIT WORDS ARE ASSEMBLED INTO 8-BIT WORDS.

M Nicholas

BOOTAH AND BOOTA

I. Function

A. General

To store two programs COPY and CALL into Bank 13 and then exit to Program Call for the next record of the BOOT STRAP file.

B. Detail

The BOOT STRAP has three records in its file. Programs BOOTAH and BOOTA, is the first record and are loaded into the 8092B core with the Load and Run switches of the Teleprogrammer starting with word 0, Bank 0. BOOTAH is a set of six bit per word instructions, when executed it builds a set of eight bit per word instructions, from two four bit words. This becomes program BOOTA. BOOTA will take the remaining four bit words, combine the high and the low orders, to build an eight bit word and stores them into bank 13. These eight bit words are program instructions belonging to COPY and CALL.

Then will exit to Program CALL for the next record of the BOOT STRAP.

II. Control Tags

TAG 1. Used while combining the high and the low order of each word before storing.

TAG 2. First set to Bank 13 to be used while storing programs COPY and CALL, then is set for the exit to program CALL.

III. Control Words

BOOTAO	Temporary storage for the building of the eight bit word.
BOOTAA	Lower order of the eight bit word.
BOOTAB	High order of the eight bit word.
BOOTAC	Temporary storage for the building of the eight bit word.
BOOTAD	Address for storing COPY and CALL.
BOOTAE	Crossing of the banks.
BOOTAF	Starting address of the four bit words.
BOOTAG	Flag test for the completion of storing COPY and CALL to their proper bank.

IV Entry Point

BOOTAH

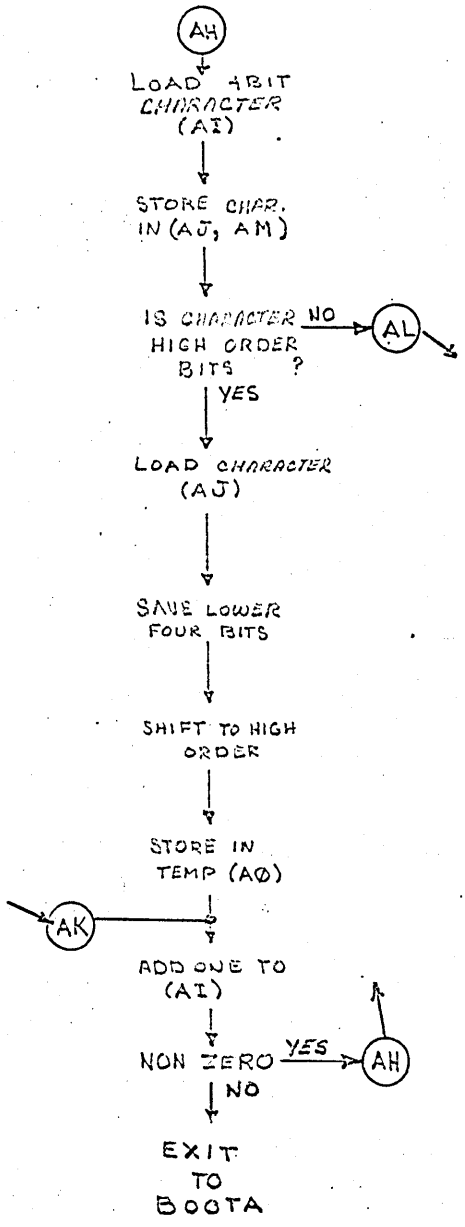
V. Exits

To Program CALL

Program Name

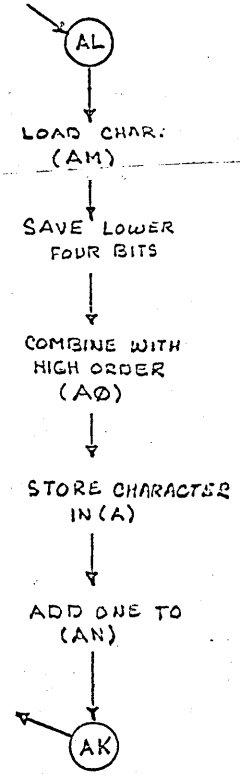
Bootah

IT ASSEMBLES A PROGRAM TO WORK WITH TAGS



PROGRAM CONTROL WORDS

BOOTAI — START ADDRESS OF FOUR BITS PER WORD
" " AJ — HIGH ORDER OF WORD
" " AM — LOW ORDER OF WORD
" " AØ — TEMPORARY STORAGE
" " AN — START ADDRESS OF 8 BITS PER WORD
" " A — START OF PROGRAM



M Nicholas

PROGRAM NAME

BOOTA

ASSEMBLES PROGRAMS COPY AND CALL
STORES THEM IN BANK 15

PROGRAM CONTROL WORDS

BOOTAA	LOW ORDER OF 4 BIT WORD
BOOTAB	HIGH ORDER OF 4 BIT WORD
BOOTAC	TEMPORARY STORAGE BUILDING WORD
BOOTAD	AREA FOR STORING 8 BIT WORD
BOOTAE	CROSSING 4BIT WORD BANKS
BOOTAF	LOAD AREA FOR 4 BIT WORDS
BOOTAG	COMPLETATION TEST

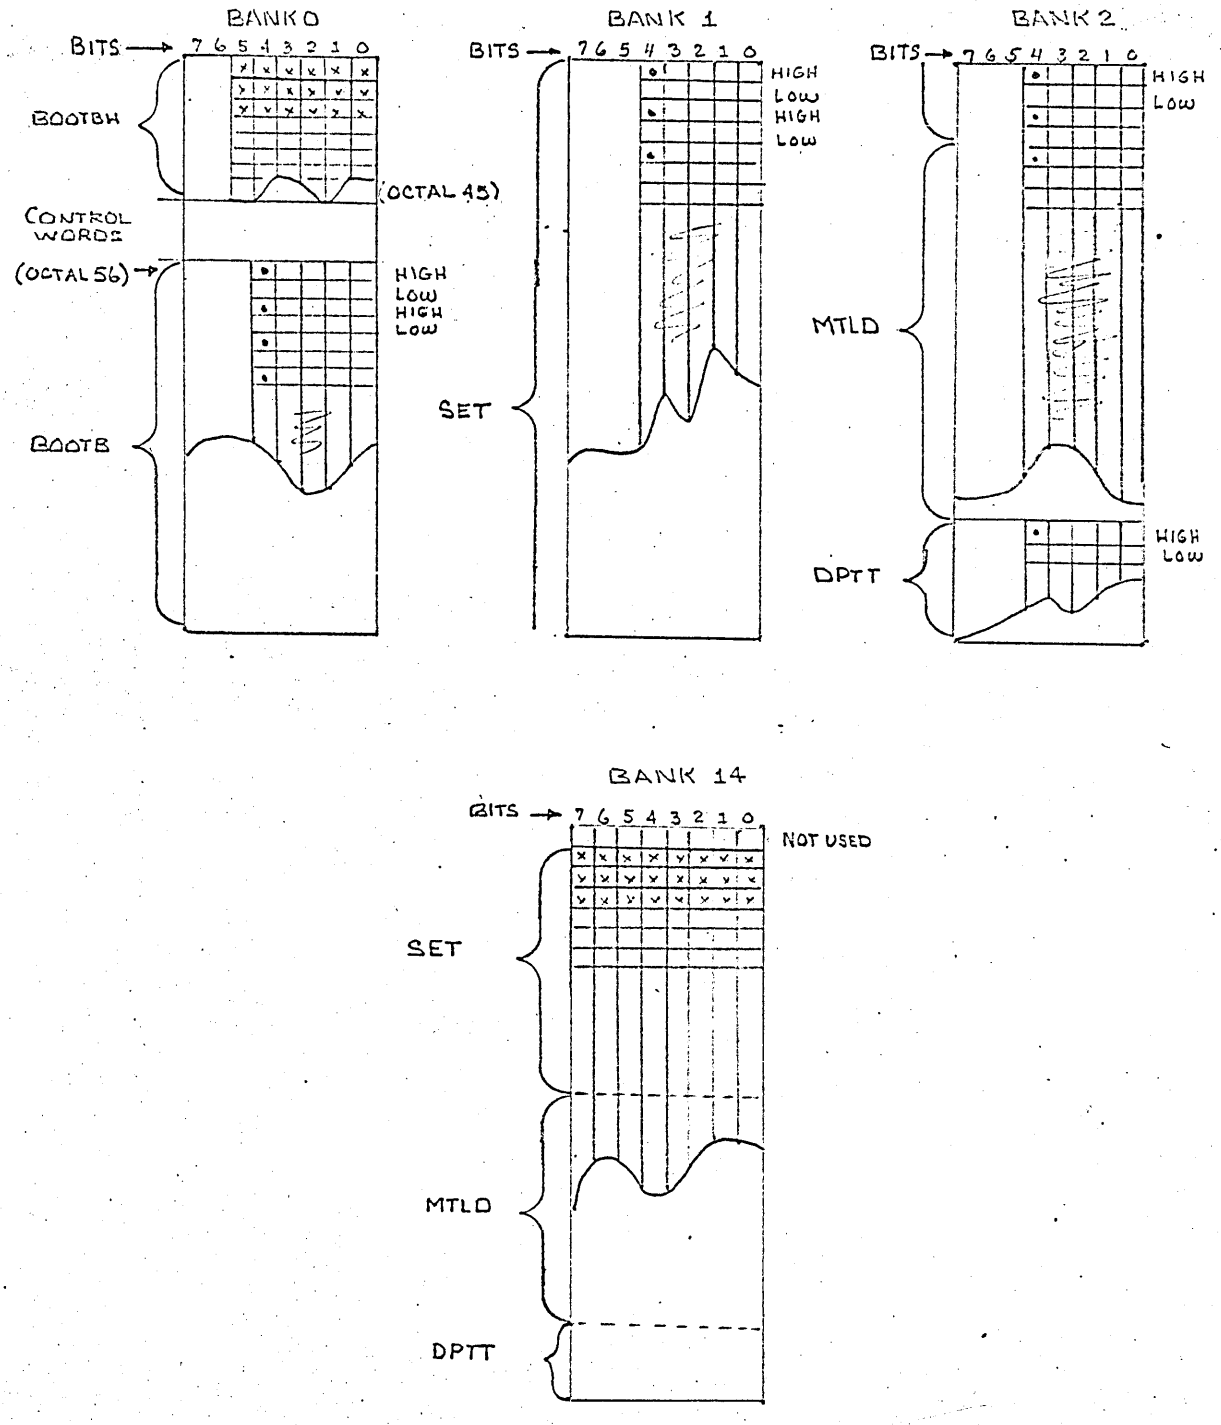
BOOTBH and BOOTB FORMAT



BOOTBH BANK-0, THE FIRST 45 (OCTAL) LOCATION ARE 6-BIT WORDS.
BANK 0 FROM 56 (OCTAL) TO 376 OF BANK 2, THEY ARE
4-BIT WORDS WITH THE HIGH ORDER FOR AN 8-BIT WORD
BEING IDENTIFIED BY BIT POSITION 4.

BANK 14 SET MTLD AND DPTT.
AFTER, THE 4-BIT WORDS ARE ASSEMBLED INTO 8-BIT WORDS.
NOTE: WORD 600 NOT USED.

M Nicholas

BOOTBH AND BOOTB

I. Function

A. General

To store the programs, SET, MTLD and part of the DPTT, into bank 14 and then exit to program CALL for the third record of the boot strap.

B. Detail

The BOOT STRAP has three records in its file. Programs BOOTBH and BOOTB, is the second record and becomes loaded into the 8092B core by program CALL, starting with address zero of bank zero. BOOTBH is a set of six bit per word instructions, when executed, it builds a set of eight bit per word instructions from two four bit words. This becomes program BOOTB. BOOTB will take remaining four bit words, combine the high and the low orders, to build an eight bit word and stores them into bank 14. These eight bit words are program instructions belonging to SET, MTLD and DPTT.

Then will exit to program CALL for record three of the BOOT STRAP.

II. Control Tags

TAG 1. Used while combining the high and the low order of each word before storing.

TAG 2. First set to bank 14 to be used while storing programs SET, MTLD and DPTT, then is set for the exit to program CALL.

III. Control Words

BOOTBO Temporary storage for the building of the eight bit word.

BOOTBA Lower order of the eight bit word.

BOOTBB High order of the eight bit word.

BOOTBC Temporary storage for the building of the eight bit word.

BOOTBD Address for storing SET, MTLD and DPTT.

BOOTBE Crossings of a bank.

BOOTBF Starting address of the four bit words.

BOOTBG Flag Test for completion of storing SET, MTLD and DPTT to their proper bank.

IV. Entry Point

BOOTHB

V. Exits

To program CALL

N Nicholas

BOOTCH AND BOOTC

I. Function

A. General

To store the remaining part of the program DPTT along with the program LDFT into bank 15, then will exit to Program CALL.

B. Detail

BOOTCH and BOOTC is the last record of the BOOT STRAP which was loaded into the 8092B core by program CALL starting with address zero of bank zero.

BOOTCH is a set of six bit per word instructions, when executed, it builds a set of eight bit per word instructions from two four bit words. This becomes program BOOTC.

BOOTC will take remaining four bit words, combine the high and the low orders to build and eight bit word and stores them into bank 15. These eight bit words are program instructions belonging to DPTT and LPFT. Then it will exit to program CALL.

II. Control Tags

TAG 1. Used while combining the high and the low order of each word before storing.

TAG 2. First set to bank 15 to be used while storing programs DPTT and LPFT, then set for the exit to program CALL.

III. Control Words

BOOTCO Temporary storage for the building of the eight bit word.

BOOTCA Lower order of the eight bit word.

BOOTCB High order of the eight bit word.

BOOTCC Temporary storage for the building of the eight bit word.

BOOTCD Address for storing DPTT and LPFT.

BOOTCE Crossings of a bank.

BOOTCF Starting address of the four bit words.

BOOTCG Flag test for completion of storing DPTT and LPFT to their proper bank.

IV. Entry Point

BOOTCH

V. Exits

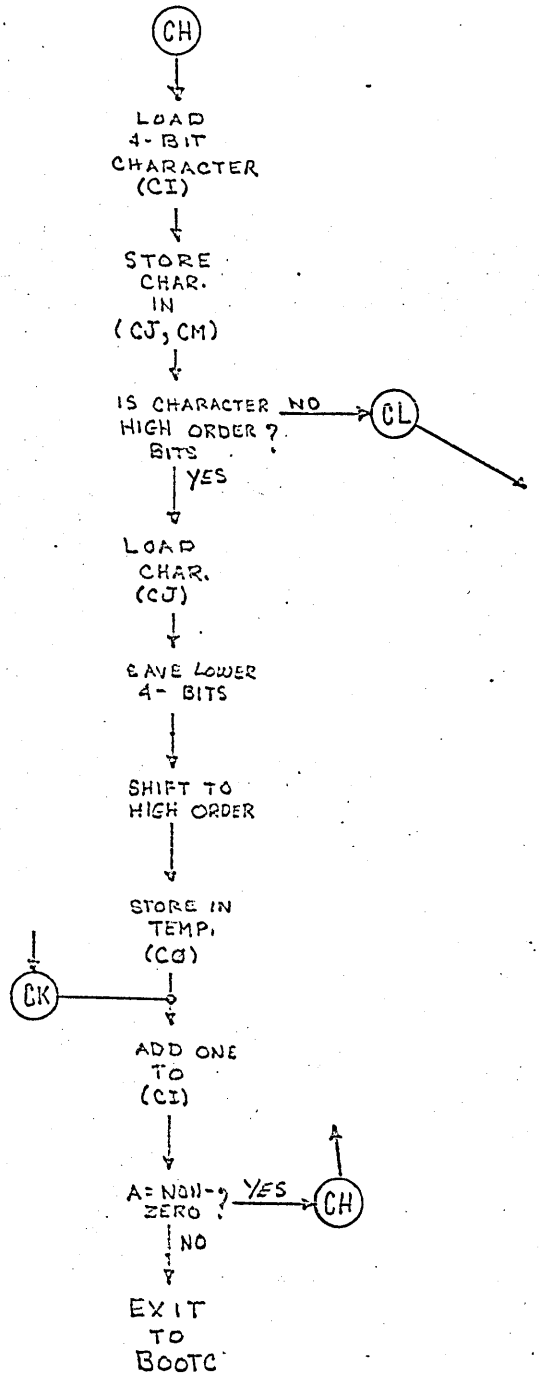
To program CALL

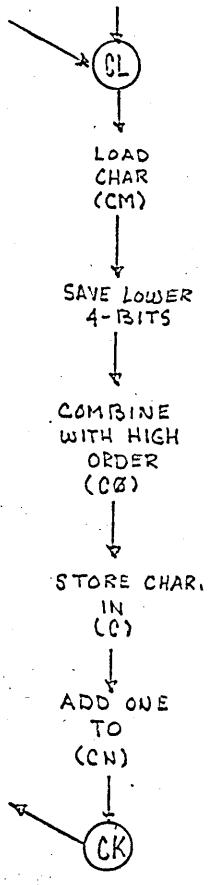
Program Name

BootCH

IT ASSEMBLES A PROGRAM TO WORK WITH TAGS

PROGRAM CONTROL WORDS	
BootCI	START ADDRESS OF 4-BIT WORDS
" " CJ	HIGH ORDER OF WORD
" " CM	LOW ORDER OF WORD
" " CØ	TEMPORARY STORAGE
" " CN	START ADDRESS OF 2BIT WORDS
" " C	START OF PROGRAM BootC





R. Nicholas

PROGRAM NAME

BOOTC

ASSEMBLES PROGRAMS DPTT AND LDFT
STORES THEM IN BANK 17

PROGRAM CONTROL WORDS

BOOTCA	LOW ORDER OF 4 BIT WORD
BOOTCB	HIGH ORDER OF 4 BIT WORD
BOOTCC	TEMPORARY STORING BUILDING WORD
BOOTCD	AREA FOR STORING 8 BIT WORD
BOOTCE	CROSSING A 4 BIT WORD BANK
BOOTCF	LOADING AREA FOR 8 BIT WORD
BOOTCG	COMPLETATION TEST

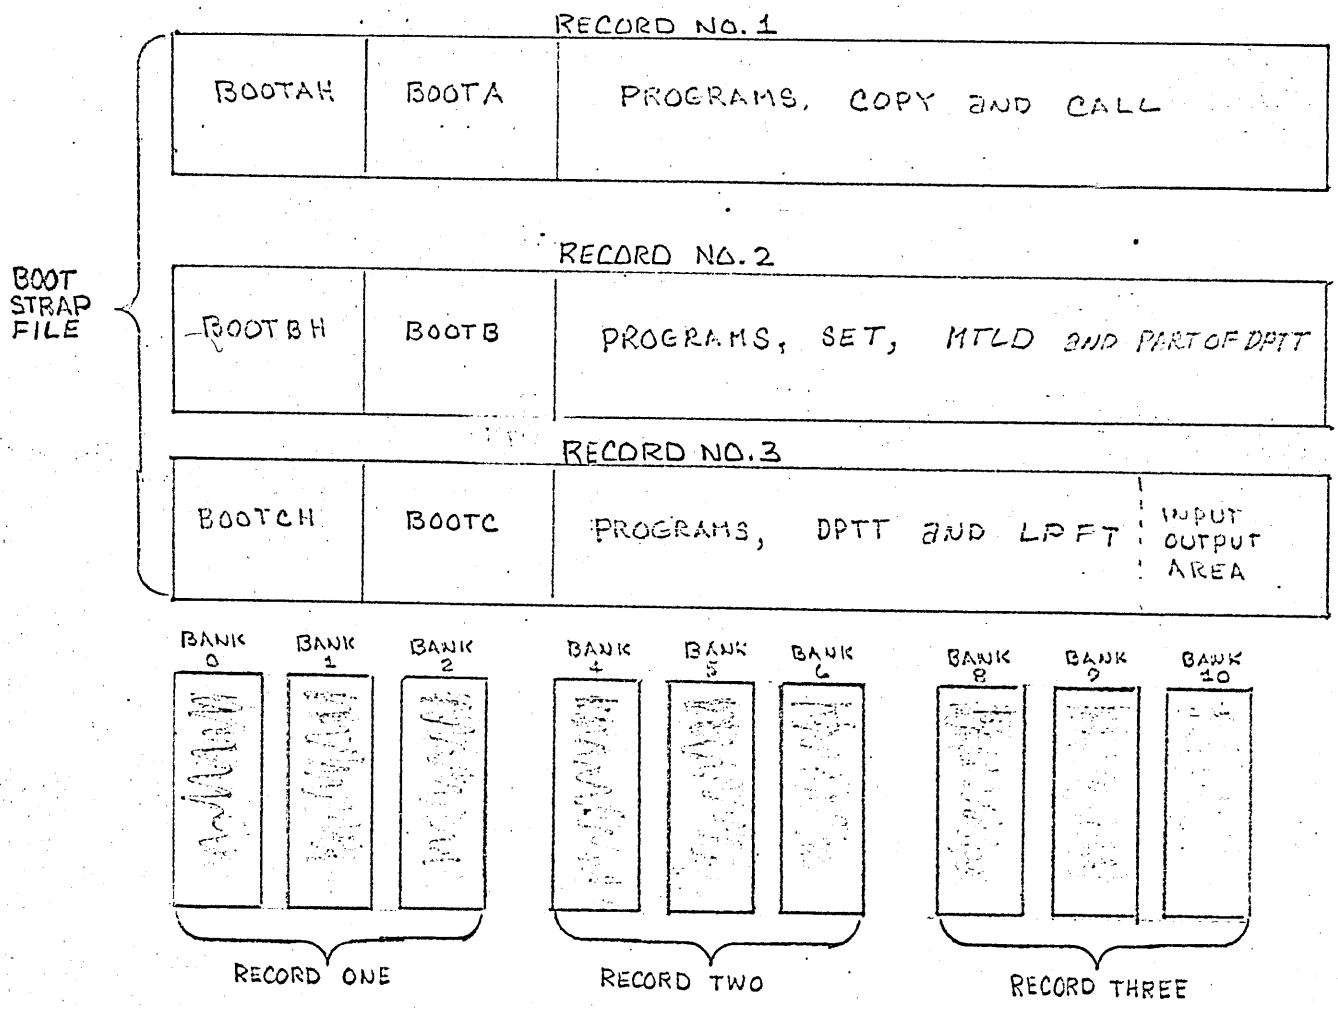
PROGRAM COPY

FORMAT

AUTOMATIC LOAD AND DUMP TAPE



FROM → AUTOMATIC LOAD AND DUMP TAPE

READS RECORD ONE INTO BANKS 0,1 AND 2. READS RECORD TWO INTO BANKS 4,5 AND 6
READS RECORD THREE INTO BANKS 8,9 AND 10.

TO NEW MAGNETIC TAPE

OUTPUTS BANKS 0,1 AND 2 (RECORD ONE) OUTPUTS BANKS 4,5 AND 6 (RECORD TWO)
OUTPUTS BANKS 8,9 AND 10 (RECORD THREE). WRITES EOF AND CODE MARK (77)

THE TAPE IS NOW AN AUTOMATIC LOAD AND DUMP TAPE.

N Nicholas

COPY

I. Function

A. General

Generates the BOOT STRAP for a new Automatic Load and Dump Tape.

B. Detail

Reads the three records of the BOOT STRAP into the 8092B core on the buffer channel. Record one of the BOOT STRAP is stored starting with zero of bank 0, to word 377 of bank 2. Record two is stored starting with word zero of bank 4, to word 377 of bank 6. Record three is stored starting with word zero of bank 8, to word 377 of bank 10. Then the program halts, so a new tape can be mounted on unit 3.

COPY writes the three records (which were stored into the 8092B core) on the buffer channel to the magnetic tape, that was mounted on unit 3, in the same sequence that they were inputted. Then it writes an end of file mark and code mark (77 octal). This tape is now a new Automatic Load and Dump Tape.

II. TAGS

TAG1 NOT USED.
TAG2 Programs execution tag.
TAG3 Used for input and output of the BOOT STRAP.

III. CONTROL WORDS

COPY A Counter for parity error while reading or writing.
COPY B Times counter of 3, for input and output.
COPY C Times counter of 2, for input and outputting the three records, just once.
COPY 4 Prestored number to increase Tag 3.
COPY 7 Prestored code for reading or writing.
COPY 8 Prestored code for inputting or outputting.

IV. ENTRY POINTS

COPY Entry point for program CALL.

EXIT

NONE.

PROGRAM NAME

COPY

COPY BOOT STRAP ON TAPE

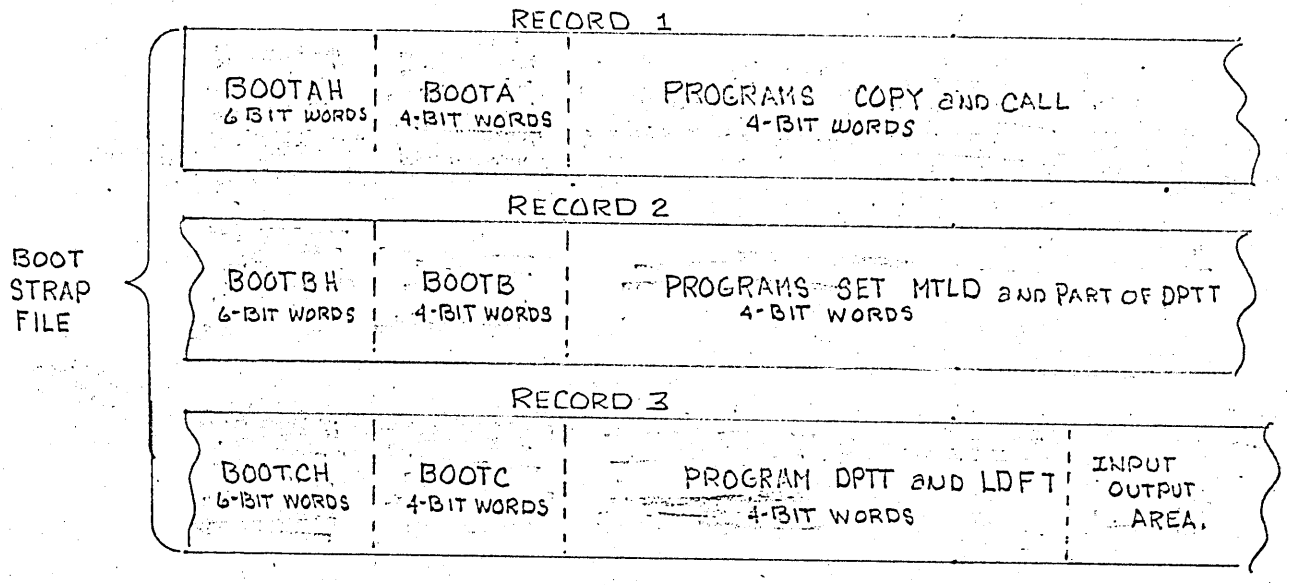
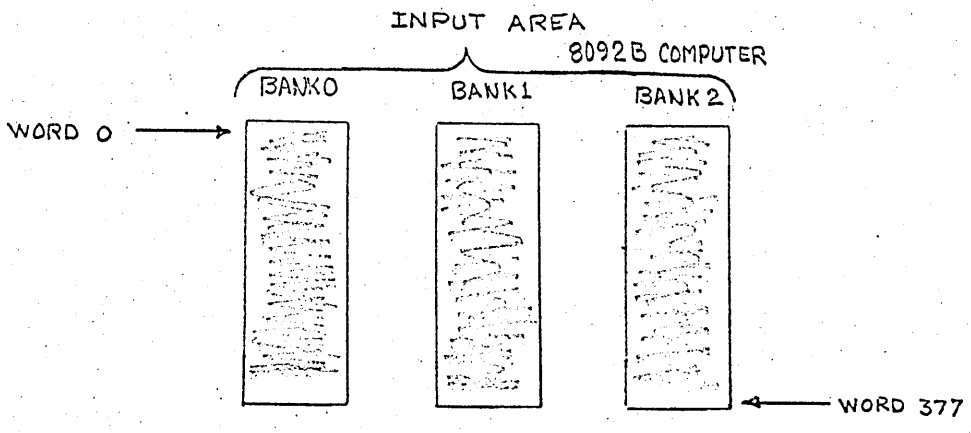
PROGRAM CALL FORMAT

AUTOMATIC LOAD AND DUMP TAPE





RECORD TWO IS INPUTTED FIRST THEN PROCESSED BY PROGRAM BOOTBH.
RECORD THREE IS INPUTTED AND PROCESSED BY PROGRAM BOOTCH.

BOTH RECORDS START IN BANK 0 WORD 0 AND END IN BANK 2 WORD 377.

CALL

I. Function

A. General

CALL brings in records two and three of the BOOT STRAP into the 8092B Core for processing.

B. Detail

The buffer channel is used to input the records. The input area starts with word zero of bank zero and ends with word 377 octal of bank two. Record two is inputed first, then CALL releases control to BOOTBH for the processing of record two from the BOOTSTRAP file.

When the processing of record two is completed BOOTBH will return control back to program CALL. CALL will input record three of the BOOT STRAP in the same manner as record two. Control is than returned to BOOTCH for the processing of record three. BOOTCH will return control to program CALL when the processing is completed.

A parity check is made on both of the records. CALL then comes to a halt to indicate that the BOOT STRAP is now loaded and ready for its job assignments. The job assignment are indicated by entering a parameter in to the A-REGISTER.

The parameter is divided into four bit indicaters. The high order four bits are for coping the BOOT STRAP or to dump a program from the 8092B Core to the Automatic Load and Dump Tape. The low order bits indicates the file number on the Automatic Load and Dump Tape either for the loading on the dumping of the 8092B core.

DUMP OR COPY HIGH	FILE NUMBER LOW	Parameter job assignments
17	0	Generates a new Automatic Load any Dump Tape.
XX XX	0 YY	Dumping of the 8092B Core to the Automatic Load and Dump Tape.
0	YY	Loading the 8092B core from the Automatic Load and Dump Tape.

```

SET

I. Function

A. General

Executive program for the reading or the writing of the Automatic Load and Dump Tape for the 8092B core.

B. Detail

SET determines the job assignment by analyzing a "job Parameter" manually entered into A-register prior to execution. This "job parameter" is structured into two four bit indicators. The high order four bits are "bank" indicators, the low order four bits are "file" indicators.

The job assignment and job parameters can be derived from this "job parameters" as follows:

BANK	FILE	JOB ASSIGNEMENT AND PARAMETERS
0	YY	- Load file YY from Automatic Load and Dump Tape.
XX	00	- Dump 8092B core bank zero to bank XX and place on Automatic Load and Dump Tape as last file.
XX	YY	- Dump 8092B Core bank zero to bank XX and place on Automatic Load and Dump Tape as file YY.

NOTE: XX must be less than 17.

If the job assignment is dumping SET will: a) determine if the file to be dumped updates an existing file and set up the number of the file to be update b) determine if the file to be dumped is a new file to be added to the tape. It sets the control words for the last bank to be outputted and if the end of file mark and code mark octal 77, is to be put on the Automatic Load and Dump Tape to indicate the last file.

If the job assignment is loading, SET will determine the number of the file on magnetic tape to be loaded. It will clear the control word for the end of file and code mark.

SET initializes all control words, fixes program MTLD to either read or write and, exits to programs LPFT or DPTT depending on the job assignment.

II. TAGS

TAG1 Not used.

TAG2 Programs execution tag. Exit tag to program MTLD.

TAG3 Used for the inputting for a record, exit tag to program DPTT.

III. Control Words

AREA First word address of the input/output area.

NUMBER Number of the file record to be dumped.

FILE The file number for dumping or loading the 8092B Core.

LAST Last bank + 1 for dumping the 8092B Core.

NOEOF To determine if E.O.F. and Core mark is to be output.

BANK Crossing of the banks while loading or dumping the 8092B Core.

CKSUM The adding of the eight-bit words while loading or dumping the 8092B Core.

FLAG Indicates the last record of the file, for dumping the 8092B Core.

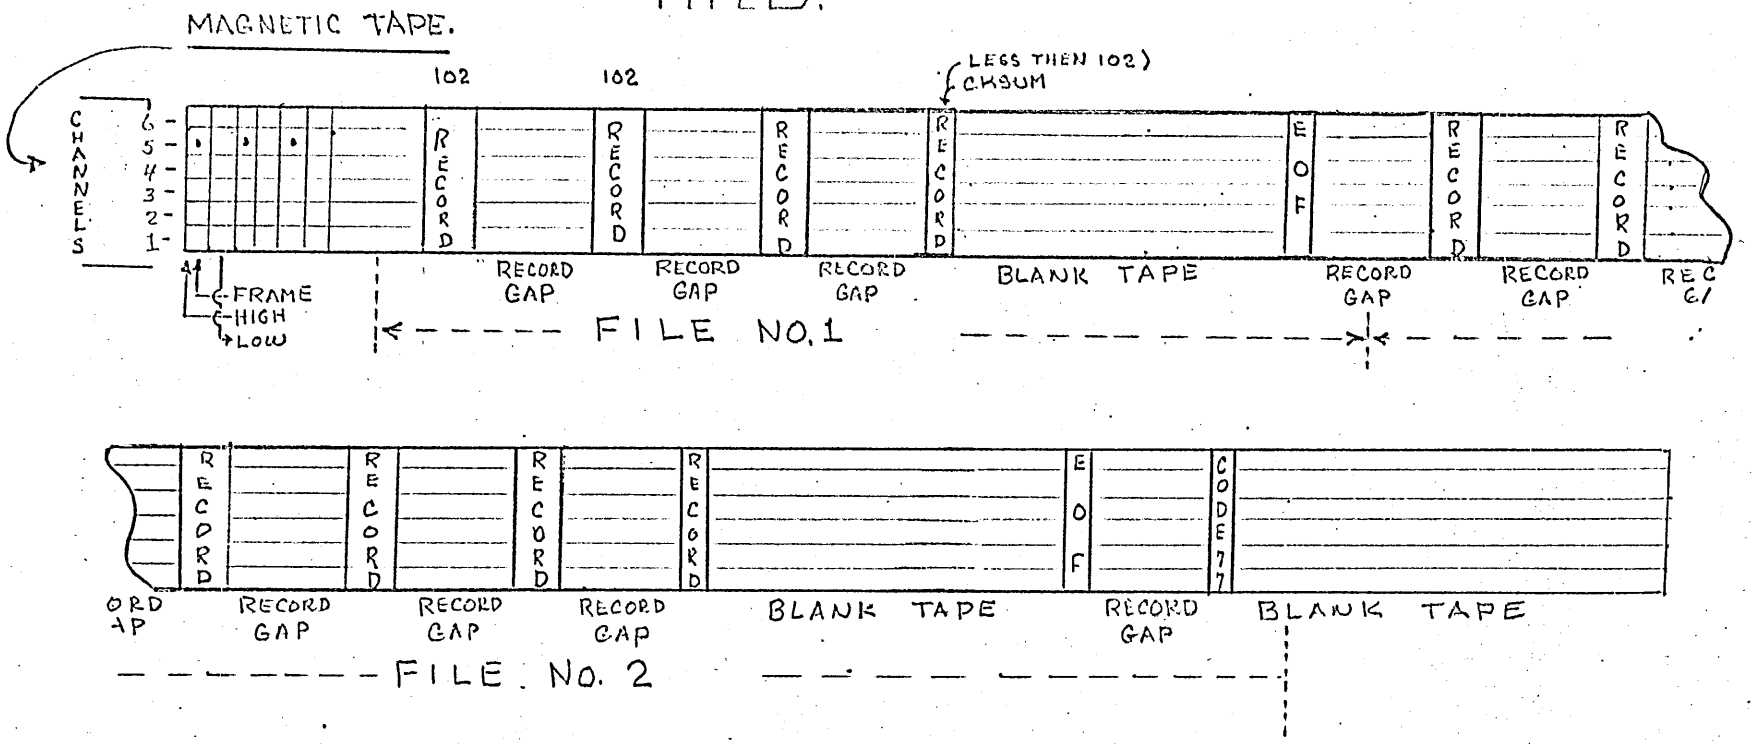
FORMAT OF INPUT AND OUTPUT FOR PROGRAM MTLD.



CHANNELS 1, 2, 3, AND 4 ARE PART OF AN 8-BIT WORD. CHANNEL 5, IS TO IDENTIFY HIGH ORDER OF THAT WORD.

THERE ARE 102 FRAMES PER RECORD. EXCEPT THE LAST RECORD OF THE FILE, ITS LESS THEN 102 FRAMES, THE CHECKSUM IS STORED IN THE LAST TWO FRAMES OF THAT RECORD. THEN BLANK TAPE BEFORE END OF FILE MARK.

FILE TWO, IS THE LAST FILE ON THIS TAPE. IT IS FOLLOWED BY BLANK TAPE, END OF FILE MARK AND CODE MARK (77) CODE MARK, ALLOWS PROGRAM "SET" TO IDENTIFY THE LAST FILE ON TAPE

N Nicholas

MTLD

I. Function

A. General

Reads or writes in binary and low density on the normal channel, variable length records up to 102 characters. Each character consists of four bits stored in the low order position of the frame.

Checks for parity errors after each record, if the parity occurs five times for the same record, the program will halt and indicate that there was a parity error on the tape.

B. Detail

The routine writes a program or file from 8092B core to the Automatic Load and Dump Tape. The program or file is recorded on the tape as a file of 102 character records (note the last record can be less than 102 characters) the routine leaves about twelve inches of blank tape between files (that is between programs written on the tape). Each file is divided by an end of file mark, except the last file on the tape, it has an end of file mark and a code mark (octal 77). Code mark identifies the last file on the Automatic Load and Dump Tape. After dumping a program or file on the tape, MTLD will come to a halt and display its file number in the A register.

The routine reads a file or program from the Automatic Load and Dump Tape. After each record is read it checks for end of file mark, if file mark is present, the check sum which was built in the program LDFT is compared with the checksum on the tape and displayed in the A-register. If the A-register equals zero, the file was loaded correctly, if other than zero, the file was loaded incorrectly.

II. TAGS

TAG1	Not used.
TAG2	Programs execution tag.
TAG3	Used with the input/output of the records. Exit tag to the programs LPFT and DPTT3.

III. CONTROL WORDS

STOP	Input or output last word address.
AREA	Input or output first word address.
SIZE	Number of characters just inputted.
FLAG	Last record to be dumped for this file.
NOEOF	Control to write file mark and code mark.
CKSOM	Checksum of the file just inputted to the 8092B core.

IV. ENTRY POINT

MTLD	Entry point for the programs SET and DPTT.

MTLD1 Entry point for the program LPFT.

V. EXITS
To LPFT
To DPTT3

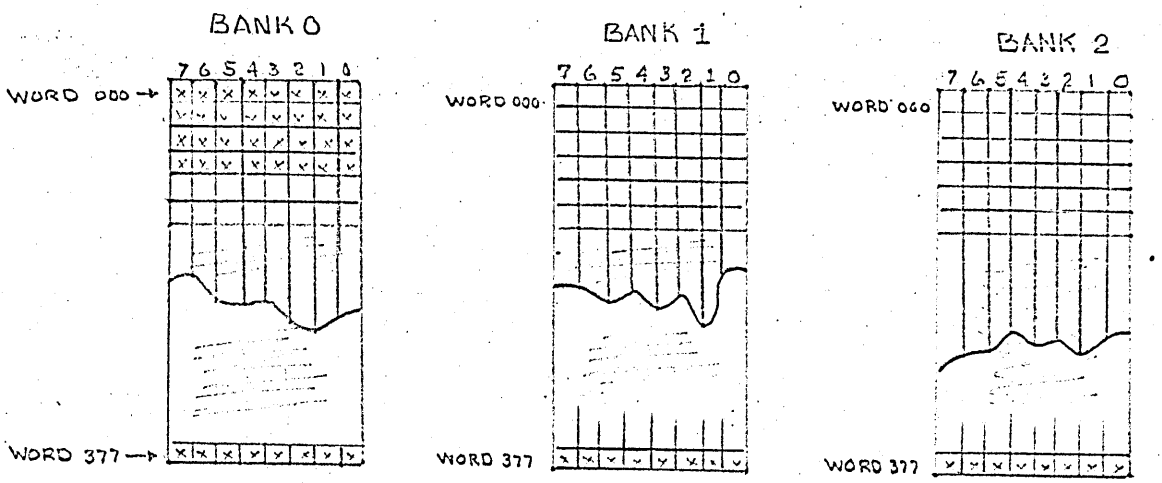
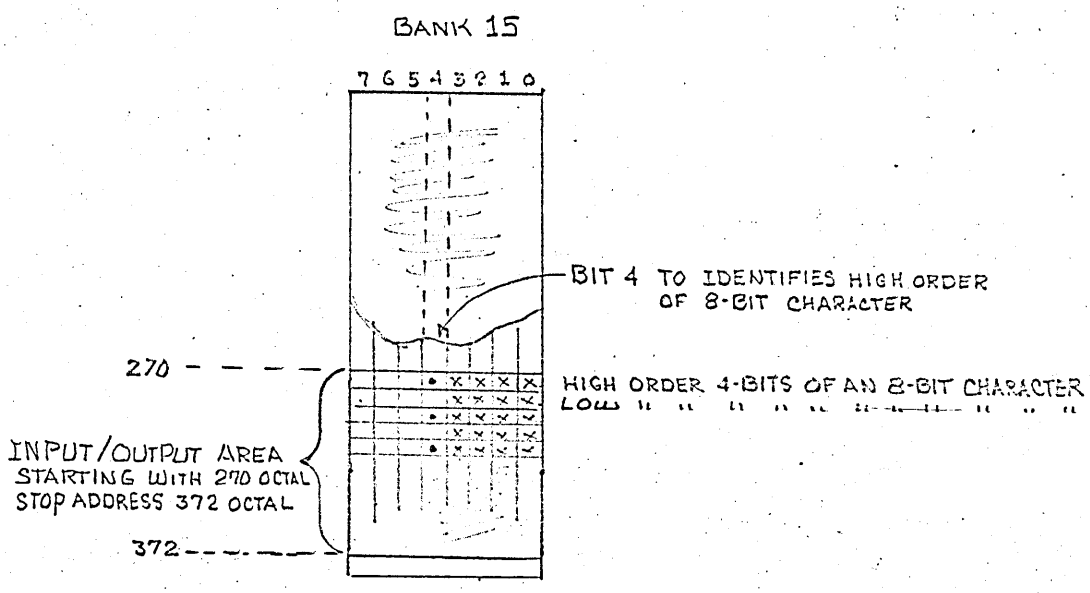
PROGRAM DPTT.
FORMAT





STARTING WITH THE WORD 000 OF BANK 0. TAKES THE 8-BITS DIVIDES THEM INTO TWO FOUR-BIT WORDS, ADDS BIT 4 TO IDENTIFIE HIGH ORDER 4-BITS OF AN 8-BIT WORD. STORE THEM INTO BANK 15 STARTING WITH ADDRESS 270 OCTAL.

n Nicholas

DPTT

I. Function

A. General

Takes an eight-bit word, checksums the eight bits then divides them into two four-bit words. The four bit words are stored into the INPUT/OUTPUT AREA so the program MTLD can output them onto the Automatic Load and Dump Tape.

B. Detail

The last word address for dumping the 8092B core, is address 377 of the last bank which was indicated for dumping. Starting address of the eight-bit words will always be word zero of bank zero. The eight bit words are checksumed, then divided into two four-bit words and identifies, the high order four bits of the eight-bit word by adding bit 4. Stores the high order word first, starting with the address of 270 octal of bank 15. The storage address is then incremented by one and the low order four-bits of the eight-bit word is stored. Both the store and start addresses are then incremented by one; then the processing of the eight-bit word will start again.

When the INPUT/OUTPUT AREA, (which is bank 15 starting with the word 270 octal as the first word address and 372 octal as the last word address) becomes filled, it releases control to program MTLD.

After the last eight bit word becomes processed the checksum word is then processed in the same manner, and sets a flag to indicate that this will be the last record for this file, then exits, to program MTLD.

Continuation

II. TAGS

TAG1 Used in the loading of the eight-bit words.

TAG2 Exit tag to the program MTLD.

TAG3 Used for storing the four-bit words into the INPUT/OUTPUT AREA, Program execution tag.

III. CONTROL WORDS

LAST The last bank + one for dumping eight-bit words.

99 CKSUM Checksum of the eight bit words just dumped.

BANK To indicate the crossing of a bank.

STOP Last word address + one of the output area.

AREA First word address of the output area.

FLAG The last record to be dumped on this file.

IV. ENTRY POINTS

DPTT Entry point for the program SET.

DPTT3 Entry point for the program MTLD.

V. EXITS TO

MTLD

PROGRAM NAME

DPTT

DUMP PROGRAM TO TAPE

PROGRAM CONTROL WORDS

LAST — LAST BANK +1 FOR DUMP
CKSUM — CHECK SUM OF LAST PROGRAM DUMPED
BANK — FLAG FOR CROSSING BANKS
STOP — OUTPUT ADDRESS +1
AREA — OUTPUT F. W. A
FLAG — DUMP IS COMPLETED

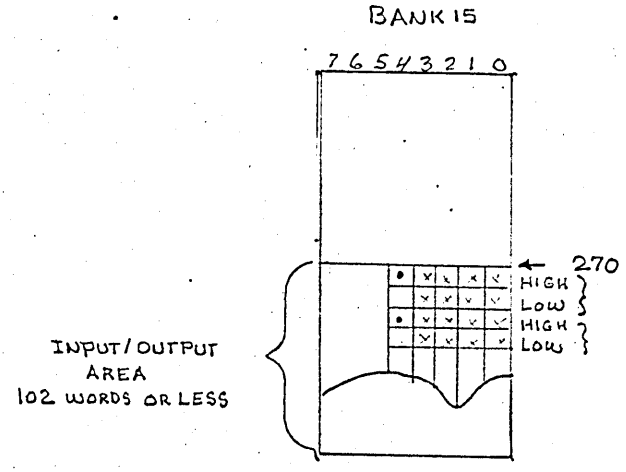
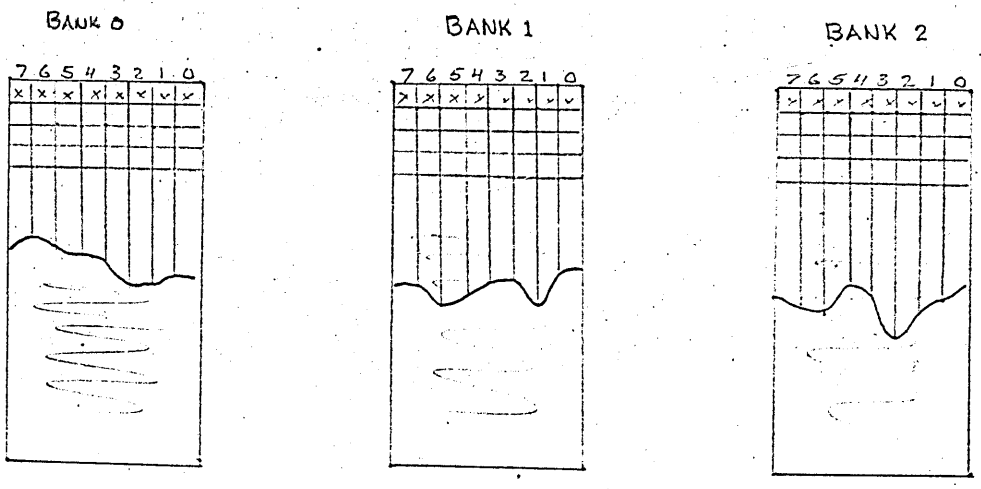
FORMAT FOR PROGRAM
LDFT



INPUT/OUTPUT AREA BITS 5, 6 AND 7 NOT USED. BIT 4 IDENTIFIES HIGH ORDER BITS. BITS 3, 2, 1 AND 0 ARE THE BITS TO BUILD AN EIGHT BIT WORD.



COMBINES THE GROUPS, HIGH AND THE LOW ORDERS OF BITS 3, 2, 1 AND 0 INTO AN EIGHT BIT WORD. BITS 3, 2, 1 AND 0 OF THE HIGH ORDER ARE SHIFTED TO BITS 7, 6, 5, AND 4 OF THE 8-BIT WORD, THEN BITS 3, 2, 1 AND 0 OF THE LOW ORDER ARE COMBINED WITH THE 8-BITT WORD, AND STORED INTO THE 8092 B CORE STARTING WITH WORD ZERO OF BANK ZERO. IT WILL CONTINUE TO COMBINE THE HIGH AND THE LOW, TAKE THE CHECKSUM AND STORES THEM UNTIL THE FILE IS COMPLETED.

N. Nicholas

LDFT

I. Function

A. General

Takes the four-bit input words and assembles them into eight-bit words, checksums the eight-bit words stores them in bank zero starting with word zero. The storage address is incremented for the next eight-bit character. The process is repeated until the program MTLD detects the end of file from the Automatic Load and Dump Tape.

B. Detail

The input words (which are inputted by MTLD) are stored in bank 15 starting with address 270. They are four bit words with identification of the four high order bits for each eight bit word. The high order bits are combined with the corresponding low order bits, in assembling an eight-bit Teleprogrammer word. This eight-bit word is checksumed and then stored into the 8092B core starting with word zero of bank zero. The storage address is then incremented by one. The process will continue until the end of file mark is detected by the program MTLD.

II. TAGS used

TAG1 Used for storing of the eight bit words.

TAG2 Exit tag to the program MTLD1.

TAG3 Used with the input of the four bit words, LDFT execution tag.

III. CONTROL WORDS

HOLD Temporary storage to build the eight bit word.

CKSUM The adding of the bits in an eight-bit word before storing.

BANK Crossing of the banks before storing next eight-bit word.

SIZE The number of characters of the last input record.

AREA The starting address of the input record.

IV. ENTRY POINTS

LDFT Entry point for the program MTLD.

V. EXITS

To MTLD1
