

Stratus XA2000 Provides Fault-Tolerant EDI Gateway

The fault-tolerant Stratus® XA™2000 computer, running EDI Solutions' EDItran® software, is well-suited as a gateway for all of a company's inbound and outbound EDI traffic. XA2000s offer the fault tolerance and the open communications needed to keep transactions flowing between a company's business applications and its trading partners' systems. The EDItran software translates data formats used by a company's internal information systems into standard EDI formats that can be accepted by its trading partners' computers. In the example shown here, a retail chain uses EDI to expedite business transactions with an apparel manufacturer.
